The international Master's / PhD Programs Molecular Biology and Neurosciences were established by the Georg August University Göttingen, together with the Max Planck Society for the Advancement of Science, in the year 2000 to attract excellent students from all over the world and provide them with an outstanding, research-oriented graduate program. Both programs are taught in English by internationally renowned scientists and offer a high level of services and individual support.

The two programs met with immediate success. By now, some 800 students from more than 70 countries apply for the 20 study places available in each of the programs every year. Over the past five years, both programs have introduced and combined elements of international recruitment, competitive admission procedures, advanced curricula, research training, social integration programs, extracurricular support and evaluation procedures into successful working structures. They have both achieved excellent recommendations in several external evaluations and have recently been awarded the 2004 prize for excellent support services for foreign students by the German Federal Foreign Office.

For the newly established Georg August University School of Science (GAUSS) and two other graduate schools in Göttingen, the Molecular Biology and Neuroscience Programs are considered exemplary and serve as best practice models.

Five Göttingen University faculties, three Göttingen Max Planck Institutes as well as the German Primate Center participate in the programs. International guest lecturers are also involved. The Max Planck Society contributes through its newly established International Max Planck Research Schools. Both programs keep close contacts with the relevant industries to further enhance the chances of the graduates for a successful professional career.

I would very much like to thank all scientific bodies and institutions for their committed support in establishing these international programs and, last but not least, the German Academic Exchange Service (DAAD), the Lower Saxony Ministry of Science and Culture and the various generous sponsors.

The Georg August University of Göttingen is proud of its long-standing international experience the two attractive and innovative programs have already become an integral part of. The university will continue to support these programs within the setting of Göttingen's lively urban, cultural and social life, in itself a prerequisite for creative teaching and research.

Prof. Dr. Kurt von Figura
(President of the Georg August University Göttingen)
The mission of the Max Planck Society is to conduct basic research in science and humanities at the highest level. More than 80 Max Planck Institutes are located on scientific campuses across Germany, most of them close to universities.

Scientific ties between Max Planck Institutes and universities are traditionally strong. In 1998, during the 50th year celebration of the Max Planck Society in Göttingen, the Max Planck Society - together with the Hochschulrektorenkonferenz - launched the International Max Planck Research Schools as a new joint program to further intensify cooperation.

The goals of the International Max Planck Research Schools are
- to attract excellent students from all around the world to intensive Ph.D. training programs in Germany, preparing them for careers in science,
- to integrate Max Planck scientists in top-level scientific training of junior scientists,
- to intensify the ties to the Universities owing to the participation of internationally renowned Max Planck scientists in joint teaching activities, and
- to strengthen international relationships by providing individual support to each student and by exposing foreign students to German culture and the German language.

By now, 43 International Max Planck Research Schools have been established involving 54 Max Planck Institutes, 55 German universities and 15 universities abroad. More than 1700 (mostly PhD-) students from 86 countries are presently enrolled. Approximately 350 PhD students have graduated to date from an International Max Planck Research School.

The success of the Göttingen International Max Planck Research Schools in Molecular Biology and Neurosciences is evident from the high quality of the students and from the hundreds of applications the programs receive each year. The Schools have also re-shaped the local scientific community, strengthened the ties between the participating institutions, and initiated new scientific collaborations that augment the international reputation of Göttingen as a center for scientific excellence. We hope that in the years to come the students of the International Max Planck Research Schools will be successful in their professional careers. We also hope that they will remember their training period in Göttingen as an exciting and stimulating phase in their lives.

Peter Gruss
President
Max Planck Society
for the Advancement of Science

Reinhard Jahn
Dean of the IMPRS
Molecular Biology
Overview

This yearbook is intended to provide information on the International MSc/PhD Molecular Biology Program in Göttingen, Germany, which was established in 2000. In addition to general information on the program, the yearbook introduces the current year’s students, the faculty members, the program committee and the coordination team.

The program is conducted jointly by the Göttingen Center for Molecular Biosciences (GZMB), a newly established scientific center of excellence at the University of Göttingen, the Max Planck Institute for Biophysical Chemistry, the Max Planck Institute for Experimental Medicine, and the German Primate Center. Further to their active participation in the Molecular Biology Program and the research activities of the GZMB, the above-mentioned partners closely cooperate in four collaborative research centers (Sonderforschungsbereiche, SFB), six interdisciplinary doctoral programs (Graduiertenkollegs, GK) and in the recently established DFG Research Center for Molecular Physiology of the Brain (CMPB).

The intensive, research-oriented curriculum of the International MSc/PhD Molecular Biology Program qualifies students for professional work in the fields of molecular and cellular biosciences. The program is open to students from Germany and from abroad, who hold a Bachelor’s degree (or equivalent) in the biosciences, chemistry, medicine, or related fields. All courses are held in English. Tuition fees are waived and scholarships are available. The academic year starts in October and is preceded by three week orientation program. Applications may be submitted until January 31 of the year of enrollment. To ensure a high standard of individual training, the number of participants is limited to 20 students per year.

All students initially participate in one year of intensive course work. This first segment of the program comprises lectures, tutorials, seminars, methods courses, and individually supervised research projects (laboratory rotations). The traditional German structure of academic semesters is not followed. The condensed schedule allows students to accumulate 90 credits (ECTS) within one year, which would normally require 3 semesters. Subsequently, two separate segments are offered:

- **PhD Program**: Good to excellent results after the first year qualify for direct admission to a three-year doctoral project in one of the participating research groups. The Master’s thesis requirement is waived in this case. After successful defense of a doctoral thesis, the degree Doctor of Philosophy (Ph.D.) or the equivalent title Doctor rerum naturalium (Dr. rer. nat.) is conferred.

- **MSc Program**: Alternatively, students may conclude the program with a Master’s thesis, based on six months of experimental scientific research. The degree Master of Science (MSc) is awarded upon successful completion of the Master’s thesis.

Intensive Course Program (First Year)

Throughout the first year, current topics in molecular biology are covered by
- lectures
- tutorials
- methods courses
- laboratory rotations
- seminars

Lectures and Tutorials

A comprehensive lecture series is organized into a sequence of 8-12 week units. The following topics are taught on an advanced level throughout the first year (36 weeks, 4 hours per week):

A. Biochemistry and Structural Biology
   - The Prokaryotic and Eukaryotic Cell
   - Introduction to Metabolism
   - Energy Metabolism, Lipid Metabolism
   - Metabolic Networks
   - Enzyme Mechanisms and Regulation
   - Protein Structure, NMR, Crystallography

B. Molecular Genetics
   - DNA and Chromatin Structure
   - DNA Replication and Repair
   - Transcription
   - Signal Transduction
   - RNA-processing and Translation
   - Genomics, Bioinformatics

C. Functional Organization of the Cell
   - Membranes: Structure and Transport
   - Protein Sorting and Processing
   - Vesicular Transport, Organelle Biogenesis
   - Cytoskeleton
   - Cell Adhesion
   - Nervous Systems, Sensory Systems
   - Cell Cycle, Apoptosis, Cancer
   - Immunology
   - Infectious Diseases, Principles of Pathogenicity

D. Model Systems of Molecular Biology/Biotechnology
   - Prokaryotes
   - Biotechnology
   - Fungi
   - Arabidopsis
   - Drosophila
   - Xenopus, Zebrafish
   - Chicken, Mouse
   - Human Genetics

Each lecture is accompanied by a tutorial session, where students meet with a tutor in small groups. Tutorials involve exercises, review of lecture material, and discussion of related topics.
During the first months of the Molecular Biology Program, students participate in a series of methods courses to introduce them to principles and practical aspects of basic scientific techniques and the handling of model organisms. The methods comprise 18 two-day experiments in small groups.

A. **Proteins**
   - Protein preparation and characterization by gel electrophoresis and Western blot
   - Chromatographic protein separation
   - NMR spectroscopy
   - Structural analysis of proteins and protein structure validation
   - Proteomics
   - Microarrays
   - Analysis of protein-protein and nucleic acid-protein interaction

B. **Nucleic Acids**
   - Purification and electrophoresis of nucleic acids
   - Polymerase chain reaction I
   - cDNA-synthesis, cloning
   - DNA sequence analysis and bioinformatics
   - Chemical and enzymatic analysis of RNA structure
   - Spectroscopic characterization of nucleic acids

C. **Cell Biology and Genetics**
   - Light microscopy
   - Electron microscopy
   - Biochemical cell fractionation
   - Cell culture
   - Expression analysis

**Laboratory Rotations**

Starting in January, every student conducts three independent research projects (laboratory rotations) in the participating departments. Each project is individually supervised. These involve seven weeks of experimental work, followed by one week for data analysis and presentation. For each project, a report must be completed in the format of a scientific publication. The laboratory rotations must cover three different subjects.
**Seminars**

Seminars start in March. The class meets weekly for two hours to discuss two student presentations. The presentations are research reports based on work from the laboratory rotations.

**Examinations**

After the first year of intensive training, all students take one written and two oral Master’s examinations. The Master’s examinations explore the students’ theoretical background in topics covered by lectures and tutorials. Each oral examination investigates the qualification in two of the following disciplines:

- biochemistry
- structural biology
- genetics
- microbiology
- cell biology
- immunology
- developmental biology

**PhD Program**

Students who have passed the Master’s examinations with good or excellent results qualify for direct admission to a three-year doctoral project in one of the participating research groups without being required to complete a Master’s thesis first.

The PhD program emphasizes independent research on the part of the students. Doctoral students select three faculty members as their doctoral committee which closely monitors progress and advises students in their research project. Laboratory work is accompanied by seminars, training in scientific writing and oral presentation skills, elective courses, and participation in international conferences or workshops.

At the end of the PhD training program, a doctoral thesis is submitted either in the traditional format, or as a collection of scientific publications in internationally recognized journals along with a general introduction and a discussion of the results. The degree PhD or, alternatively, Dr. rer. nat. will be awarded after the successful defense of the doctoral thesis.
Master’s Program

After the first year of intensive training, students may conclude the program with a six-month thesis project, leading to a Master of Science degree. The thesis project involves experimental work under the supervision of faculty member of the Molecular Biology Program.

Orientation, Language Courses, Social Activities

A three-week orientation prior to the program provides assistance and advice for managing day-to-day life in Germany, including arrangements for bank account, health insurance, residence permit, housing, and enrollment. Students have the opportunity to meet faculty members and visit laboratories of the participating institutions. In addition, the orientation program informs students about computing and library facilities, the city and university of Göttingen, sports facilities, and cultural events.

An intensive basic language course in German is offered in cooperation with Lektorat Deutsch als Fremdsprache to facilitate the first weeks in Göttingen. Additional language courses and social activities accompany the program.

Application, Selection and Admission 2005

Applicants must hold a Bachelor’s degree or equivalent in biology, biochemistry, chemistry, medicine, agriculture, or related fields. They are required to document their proficiency in English and should not be older than 27 years.

In the year 2005, the coordination office received 568 applications from 68 countries.

EDUCATION

College / University
2002 - 2005 Dresden University of Technology, Germany

Highest Degree
B.Sc.

Major Subjects
Molecular Biotechnology

Lab Experience
Various techniques in molecular biology, including realtime-PCR, cloning, protein purification and folding, cell and tissue culture, microscopy

Projects / Research
03/2005 - 09/2005 (Bachelor’s thesis): “Characterization of mammary epithelial cells HC11 during different stages of development on estrogenic effects”. Molecular Physiology and Endocrinology, Dresden University of Technology, Dresden, Germany
04/2004 - 08/2005: "Influences of temperature change on the motility of keratocytes." Light Microscopy Facility, Max Planck Institute for Cell Biology and Genetics, Dresden, Germany
08/2004 - 10/2004: "Generation of novel DNA vaccines for immunotherapy". Tumor Immunotherapy, Hanson Institute, Adelaide, Australia
06/2002 - 09/2002: "Protein folding in vitro" Protein Technology, Martin-Luther University, Halle, Germany

Scholarships
2005 - 2006 Stipend International Max Planck Research School

SCIENTIFIC INTERESTS AND GOALS

I am very interested in the holistic understanding of proteins, cells, tissues and signaling pathways. In particular, my main scientific interest focuses on applied medical research. Through this program I hope to obtain an insight into different research areas.

EDUCATION

College / University
2002 - 2005 University of Lübeck, Germany
08/2004 - 12/2004 University of New Mexico, Albuquerque, NM, USA

Highest Degree
B.Sc.

Major Subjects
Molecular Biology, Biochemistry, Cell Biology

Lab Experience
Various methods in biochemistry and molecular biology. Animal tissue culture, fluorescence microscopy, TEM

Projects / Research
02/2005 - 08/2005 Bachelor's thesis: "Fibroblast seeding on woven Dacron fabric - A contribution to the optimization of the blood contact surface of biomechanical hearts". Lübeck, Germany
10/2004 - 12/2004 Undergraduate Research: "Introduction to use of microscopy to study protein-protein and protein-RNA interactions". Dept. of Cell Biology and Physiology, University of New Mexico, NM, USA
06/2003 - 07/2003 Expression and purification of recombinant in E. coli. Dept. of Biology, University of Lübeck, Germany

Scholarships
2005 - 2006 Stipend International Max Planck Research School
08/2004 - 12/2004 Student exchange scholarship at the University of New Mexico

SCIENTIFIC INTERESTS AND GOALS

There are many aspects of molecular and cellular biology which interest me, especially the processes underlying cellular migration and differentiation, but also the molecular basis of disease. Through this program I would like to deepen my theoretical and practical knowledge in molecular and cellular biology and hope to gain an insight into different areas of research.
Monika Bug

EDUCATION
College / University
2002 - 2005 University of Lübeck
08/2004 - 12/2004 University of New Mexico, Albuquerque, NM, USA

Highest Degree
B.Sc. (Molecular Life Sciences)

Major Subjects
Cell Biology, Biochemistry, Molecular Biology, Biophysical Chemistry

Lab Experience
Biochemical, cell biological and molecular biological techniques

Projects / Research
01/2005 - 07/2005 Bachelor's thesis: "Characterization of the binding of the cytosolic protein p97 to the membrane of the endoplasmic reticulum", Institute of Biology, University of Lübeck

Scholarships
2005 - 2006 Stipend International Max Planck Research School
2004 Student Exchange Scholarship at the University of New Mexico (Albuquerque, USA)

since 2002 Scholarship from the SDW (Stiftung der Deutschen Wirtschaft)

SCIENTIFIC INTERESTS AND GOALS
I am interested in cell biological processes, such as signal transduction and carcinogenesis. I hope to deepen my knowledge in biological sciences in order to work on biological and medical research in an international and interdisciplinary environment. Through this program I hope to obtain a practical insight into various fields in molecular biology and into diverse research areas.

Ieva Gailite

EDUCATION
College / University
2002 - 2005 University of Latvia, Riga, Latvia

Highest Degree
B.Sc.

Major Subjects
Biochemistry, Microbiology, Cell Biology

Lab Experience
Basic techniques in molecular biology and microbiology

Projects / Research
2003 - 2005 "Factors influencing viability in state of anhydrobiosis of yeast Saccharomyces cerevisiae grown under aerobic and anaerobic conditions", Institute of Microbiology and Biotechnology, University of Latvia, Riga, Latvia

Scholarships
2005 - 2006 Stipend International Max Planck Research School
2004 - 2005 K. Morbergs Scholarship, University of Latvia
2004 - 2005 M. Petkevica Memorial Scholarship, University of Latvia

SCIENTIFIC INTERESTS AND GOALS
In my opinion, the central question in biology is the origin and evolution of life, therefore I am particularly interested in evolutionary aspects of cell and molecular biology, e.g. evolution of organelles. I am also interested in mechanisms that endow cells with the ability to survive under extreme environments. However, I also find other areas of biology, such as neurobiology and developmental biology, intriguing. Through my participation in this program I would like to broaden and deepen my knowledge of molecular biology and become acquainted with new molecular biology techniques.
EDUCATION
College / University
2001 - 2005 University of Tehran, Tehran, Iran
Highest Degree
B.Sc. (Cellular & Molecular Biology)
Major Subjects
Structural biology, biophysical chemistry, biochemistry and molecular biology
Lab Experience
Major techniques in biochemistry, cell and molecular biology and protein purification methods
Projects / Research
Mar 2003 - Sep 2004 Purification of cellulase from T. reesei, Department of Biology, Faculty of Science, University of Tehran, Tehran, Iran
Oct 2004 - Jul 2005 The effect of glycation on cellulase activity and structure, Department of Biology, Faculty of Science, University of Tehran, Tehran, Iran
Scholarships
2005 - 2006 Stipend International Max Planck Research School
2005 University of Tehran award for the first rank in graduates of Cellular & Molecular Biology

SCIENTIFIC INTERESTS AND GOALS
I am eager to understand the principles of physical chemistry and mathematics from the viewpoint of their applications to biochemical systems. I am also interested in the prediction of protein structures, understanding the structure-function relationships of biomolecules and the computational analysis of biological systems.

EDUCATION
College / University
2002 - 2005 Eberhard-Karls-Universität Tübingen
Major Subjects
Biochemistry
Lab Experience
Basic techniques in biochemistry and molecular biology. Synthesis and analysis of organic and inorganic substances.
Projects / Research
4/2005 - 7/2005 "Acute renal failure in zebrafish", Brigham and Women's Hospital, Harvard Institutes of Medicine, Boston
Scholarships
2005 - 2006 Stipend International Max Planck Research School
2002 - present Studienstiftung des deutschen Volkes (German National Academic Foundation)
2002 - 2004 Fonds des Verbandes der Chemischen Industrie (Association of Chemical Industry)

SCIENTIFIC INTERESTS AND GOALS
The sophisticated organisation of organisms and their complexity fascinate me. I want to achieve a deep understanding of the molecular mechanisms leading to human diseases and contribute to the development of therapies in the future.
Katharina Hoff

**EDUCATION**

**College / University**
- 10/2002 - 09/2005 University of Hannover
- 09/2004 - 09/2005 Swedish University of Agricultural Sciences Alnarp (SLU)

**Highest Degree**
- B.Sc.

**Major Subjects**
- Bioinformatics/Biometry, Molecular Biology

**Lab Experience**
- Extraction of various biochemical compounds from plant material, chromatography, PCR, agarose gel electrophoresis, semi-quantitative RT-PCR, cloning, transformation of bacteria and plants, plant tissue culture.

**Projects / Research**
- 2005 "An investigation of PDAT2 in Arabidopsis thaliana", SLU
- 2005 "R-Manual for Biometry - an introduction for students of horticulture and plant biotechnology", University of Hannover
- 2004 - 2005 "Silencing DAGAT2 and CPT1 in Arabidopsis thaliana with RNAi", SLU
- 2004 "Cumarin content in Rubia tinctorum", Semmelweis University Budapest

**Scholarships**
- 2005 - 2006 Stipend International Max Planck Research School
- 2005 Scholarship by the Swedish University of Agricultural Sciences Alnarp
- 2004 - 2005 ERASMUS stipend, Stipend by Stiftung der Deutschen Wirtschaft
- 2003 - 2005 e-fellows.net online stipend

**SCIENTIFIC INTERESTS AND GOALS**

I am interested in metabolic pathways, especially in plant lipid formation. In my opinion, genetically modified seed oil is the future replacement of mineral oil in the sector of industrial oils. I want to improve my theoretical knowledge as well as my practical skills in the course of this program. I am very much looking forward to meeting people with other scientific and cultural backgrounds.

Georgi Hristov

**EDUCATION**

**College / University**
- 2002 - 2005 International First Level Degree "Job Creation Oriented Biotechnology"
  Universita degli Studi di Perugia (Perugia, Italy)

**Highest Degree**
- B.Sc.

**Major Subjects**
- Biotechnology

**Lab Experience**
- Major techniques in molecular biology, genetics and biochemistry

**Projects / Research**
- 01/2005 - 06/2005 Bachelor's thesis: "Identification of SHOX interacting proteins relevant to bone formation and development", Institute of Human Genetics, University of Heidelberg, Germany
- 06/2004 - 08/2004 "Optimization of the expression of HSV-1 ICP27 regulatory protein by using Baculovirus expression systems", Institute of Virology, University of Glasgow, UK
- 06/2003 - 08/2003 "Promoter analysis of the ARIADNE gene family", Center for Applied Genetics, BOKU University, Vienna, Austria

**Scholarships**
- 2005 - 2006 Stipend International Max Planck Research School
- 2003 - 2004 Erasmus scholarship

**SCIENTIFIC INTERESTS AND GOALS**

I am particularly interested in the fields of molecular genetics and gene therapy and their applications in the treatment of human diseases. During this course, however, I hope to deepen my knowledge in other interesting and promising research areas and make the right decision for my future scientific career.
EDUCATION
College / University
2002 - 2005 International First Level Degree "Job Creation-Oriented Biotechnology", Universita degli Studi di Perugia, Italy

Highest Degree
B.Sc.

Major Subjects
Biotechnology

Lab Experience
Tissue culture, microscopy, DNA and RNA isolation, gene cloning, gel electrophoresis, PCR, RT-PCR, recombinant protein expression and purification, SDS-PAGE, Western blot, ELISA, transfection, transduction, Southern blot, FACS

Projects / Research
06/2003 - 08/2003 "Teagasc National Survey for Strobilurin-resistant strains of Septoria". Teagasc - Oak Park Research Center, Carlow, Ireland
06/2004 - 08/2004 "Transcriptional analysis, cloning and expression of genes/proteins belonging to the flagellar apparatus of Chlamydia pneumoniae". Hygiene Institute, Dep. of Medical Microbiology, Göttingen, Germany
01/2005 - 06/2005 "Lentiviral vectors for marking undifferentiated or differentiated stem cells". Hospital for Sick Children, Dept. of Developmental Biology, Toronto, Canada

Scholarships
2005 - 2006 Stipend International Max Planck Research School

SCIENTIFIC INTERESTS AND GOALS:
My goal for this program is to improve my practical skills and to further broaden my knowledge in molecular biology in order to find the scientific field that interests me the most. During my previous education I found myself particularly interested in topics dealing with immunology, cellular signaling pathways and gene therapy.

SCIENTIFIC INTERESTS AND GOALS:
Konstantina Marinoglou

**EDUCATION**

**College / University**
University of Athens, Greece

**Highest Degree**
B.Sc.

**Major Subjects**
Biology

**Lab Experience**
Basic molecular techniques, bacteria and phage cultures, DNA-RNA-protein extraction from insects, working with radioactive phosphorus, PCR

**Projects / Research**
Jun 2003 - Feb 2005 Diploma thesis: "Structure and organization of the Bactrocera olea sex determining gene sex-lethal.", Molecular Genetics laboratory of Biology Department, University of Athens, Greece

**Scholarships**
2005- 2006 Stipend International Max Planck Research School

**S C I E N T I F I C  I N T E R E S T S  A N D  G O A L S**

Biomedical research, especially in cancer, genetic diseases and gene expression control. I wish to further improve my knowledge and gain more practical experience in order to put this to use later as a researcher.

Magdalena Morawska

**EDUCATION**

**College / University**
2002 - 2005 Intercollegiate Faculty of Biotechnology, Gdansk University-Medical University of Gdansk, Poland / International First Level Degree: “Job Creation Oriented Biotechnology” at Universita degli Studi di Perugia, Italy

**Highest Degree**
B.Sc.

**Major Subjects**
Biotechnology

**Lab Experience**
Various biochemical and molecular biology techniques, cell culture, nucleic acids and protein methods

**Projects / Research**
01/2005 - 06/2005 "Isolation of novel chimpanzee adenovirus and development of vector transfer system”. IRBM Merck Research Laboratories, Roma (Italy)
06/2004 - 08/2004 “Paroviruses: role of infection with adeno-associated virus (AAV) of human heart tissue, addressing a possible role of this virus in cardiomyopathies”. German Cancer Research Center, Heidelberg, Germany
06/2003 - 08/2003 "The lambda pR promoter activity in Escherichia coli cgtA mutant”. Institute of Biochemistry and Biophysics of Polish Academy of Science, Gdansk, Poland

**Scholarships**
2005 - 2006 Stipend International Max Planck Research School
2003 - 2005 Scholarship for academic excellence, Dept. of Biotechnology, Gdansk, Poland
09/2004 - 12/2004 Socrates/Erasmus Scholarship

**S C I E N T I F I C  I N T E R E S T S  A N D  G O A L S**

I am fascinated by viruses. Through the MSc program I hope to obtain a solid theoretical background and an insight into diverse research areas.
EDUCATION

College / University
2000 - 2005 Faculty of Science, University of Sarajevo, Bosnia and Herzegovina

Highest Degree
Diploma in Biology

Major Subjects
Genetic Engineering and Biotechnology

Lab Experience
Basic techniques in various biological disciplines

Projects / Research / Publications
11/2004 - 07/2005 Diploma thesis project: "Comparative analysis of three different approaches in DNA extraction from various blood stains", Institute for Genetic Engineering and Biotechnology, Sarajevo, Bosnia and Herzegovina: Expertus Forensis 3(5): 27-33 and poster: 4th European-American School in Forensic Genetics and Mayo Clinic Course in Advanced Molecular and Cellular Medicine, Dubrovnik, Croatia
10/2002 - 07/2003 "Analysis of haemolymph proteins of Eobania vermicularia Muller" and "Biochemical and haematological typisation of Bosnian mountain pony", Department of Biology, Faculty of Sciences, University of Sarajevo

Scholarships
2005 - 2006 Stipend International Max Planck Research School
April 2004 The Federal Ministry of Education of Bosnia and Herzegovina Grant

SCIENTIFIC INTERESTS AND GOALS

Through this program, I hope to gain good theoretical and practical background, in molecular biosciences and subsequently make a decision on further educational/research activities. At the moment, I am very much interested in signal transduction, but I also find behavioural genetics rather challenging and intriguing.

EDUCATION

College / University
2002 - 2005 University of Göttingen

Major Subjects
Biology, Biochemistry

Lab Experience
DNA & RNA isolation and visualisation methods, PCR, restriction mapping, cell culture, transfection, HPLC, GC, GC/MS, Western Blot, antibody staining, ELISA, Flow Cytometry (FACS) and major microbiological techniques

Projects / Research
2003 - 2005 "Lipid metabolism and role of oxylipins in plant development and stress response". Department of Plant Biochemistry, University of Göttingen
2005 "Role of STAT3 and the JAK/STAT pathway in B-Cell Lymphoma pathogenesis". Department of Hematology and Oncology, University of Göttingen

Scholarships
2005 - 2006 Stipend International Max Planck Research School

Publications

SCIENTIFIC INTERESTS AND GOALS

My particular interests lie in the regulation of gene expression and metabolism, membrane trafficking, immunology and developmental biology and their role in malignancy, especially carcinogenesis. The explicit understanding of the molecular processes involved in disease will lead to new approaches of healing and that is what I am eager to work on.
Iryna Shnitsar

EDUCATION

College / University
09/1998 - 06/2004 The University of Kyiv-Mohyla Academy (UKMA)

Highest Degree
M.Sc.

Major Subjects
Biochemistry and Molecular Biology

Lab Experience
Basic techniques in biochemistry, molecular biology, microbiology, and cell culture

Projects / Research / Publications

Scholarships
2005 - 2006 Stipend International Max Planck Research School

SCIENTIFIC INTERESTS AND GOALS

Signal transduction and changes in gene expression during the processes of organism’s development. Spatial organization of cells and its role in cell functioning, differentiation and malignant transformation processes. Cell signaling and the role of protein modifications (sumoylation, mono-ubiquitination, ADP-ribosylation) in it. Development of new methods, allowing us to study the cell as a holistic and highly organized system.

Hannes Uchtenhagen

EDUCATION

College / University
2002 - 2005 Friedrich-Schiller-University Jena, Germany

Highest Degree
M.Sc.

Major Subjects
Molecular Biology / Biochemistry

Lab Experience
Basic molecular biology, biochemistry and biophysical chemistry techniques

Projects / Research
2005 Internship at the Zentrum für molekulare Neurobiologie Hamburg (ZMNH): Receptor transport and scaffolding at the postsynaptic site at inhibitory synapses

2004 - 2005 Expression analysis of herbivory-induced genes of Medicago truncatula and Lima Bean and isolation of an (E)-ß-Ocimene-Synthase from Lima Bean’s cDNA. MPI for Chemical Ecology in Jena, Germany

Scholarships
2005 - 2006 Stipend International Max Planck Research School

Publications

SCIENTIFIC INTERESTS AND GOALS

I am very interested in getting to know a broad range of projects in different fields such as immunology, NMR or gene regulation and protein expression to expand my horizon and find out where my strengths and weaknesses lie.

Hannes Uchtenhagen

S C I E N T I F I C  I N T E R E S T S  A N D  G O A L S

I am very interested in signal transduction and gene expression analysis. For example, in immunology cytokines activate diverse gene expression programs in immune cells and are essential for a successful response to a pathogen. It is intriguing to understand signaling and transcriptional gene regulation processes leading to inflammation or differentiation of cells. Several fields of molecular biology, such as developmental biology, are still new for me. Through this program I hope to gain a strong base of knowledge in preparation for future specialized research.

Major Research Interests

Carbon dioxide (CO$_2$) is an essential gas for all organisms. Assimilation of CO$_2$ by autotrophs such as the photosynthetic higher plants, algae and cyanobacteria constitutes the primary biosynthetic activity in the biosphere. In addition to these organisms there is a great diversity of photo- and/or chemooautotrophic bacteria and archaea. Such organisms are often facultative autotrophs, i.e. they are able to grow either autotrophically or heterotrophically. The mutual shift between autorophy and heterotrophy requires a sophisticated regulation on the metabolic as well as genetic level.

*Ralstonia eutropha* is an aerobic, facultatively chemooautotrophic bacterium that assimilates CO$_2$, like the majority of autotrophs, via the Calvin-Benson-Bassham (CBB) carbon reduction cycle. A main interest of our laboratory concerns the transcriptional control of the cbb operons encoding most of the CBB enzymes in *R. eutropha*. The regulatory components of the cbb system, their response to metabolic signals and the interlocking of the cbb control with larger regulatory networks are the prime research subjects.

Besides hydrogen, formate serves as an energy source during organoautotrophic growth of *R. eutropha*. Formate is oxidized to CO$_2$ by formate dehydrogenases which are molybdo- or tungstenzymes in this organism. Another research topic addresses the genetic organization and transcriptional regulation of the formate dehydrogenases. We are also interested in the biosynthesis of the molybdo-/tungstopterin cofactor. The third field of research is the basal CO$_2$ metabolism in *R. eutropha* and *Escherichia coli*. It focusses on the physiological role(s) of carbonic anhydrase(s) and potential CO$_2$/bicarbonate uptake systems.

Major Research Interests

Metabolism and Development in Filamentous Fungi and Yeasts.
Amino acids are essential precursors of translation and their biosynthesis is carefully regulated at multiple levels. In fungi, amino acid starvation activates a complex genetic network including a signal transduction pathway and the transcriptional activator Gcn4p/CpcAp. This network co-ordinately regulates hundreds of genes in numerous biosynthetic pathways.

We are interested in the components of this genetic system, the crosstalk to other metabolic genetic networks in the cell (N-metabolism, purine biosynthesis), the transcriptional regulation and the chromatin structure of target genes. The stability of the transcription factor is controlled in the nucleus in an amino acid dependent degradation pathway which is analysed.

The amino acid network interacts with developmental fungal programs. Amino acid starvation induces adhesion to surfaces in yeast or arrests the formation of fruitbodies in the filamentous fungus A. nidulans. The control of protein degradation is a key feature of fruitbody formation and requires the COP9 signalosome, a highly conserved multienzyme complex which is characterized. We are interested in analysing the control points and the molecular switches which connect metabolism and development.

Another interest of the laboratory is the construction of amino acid biosynthetic enzymes with altered regulatory response. Therefore we analyse the intramolecular signal transduction pathway within regulated allosteric enzymes from the regulatory site to the catalytic center. The crystal structures of several mutant chorismate mutases and DAHP synthases served as example which gave us first hints how different effectors act on this enzyme.

Selected Recent Publications

Bertram Brenig

Full Professor of Molecular Biology of Livestock

- Director of the Institute of Veterinary Medicine
- Dr. med. vet., University of Munich, Munich 1987

Major Research Interests

The main interest of the laboratory is in the structural and functional analysis of mammalian genes and genomes. We are investigating the cause of different economic important genetic defects in livestock and other domesticated animals. So far our main focus was on porcine genes and their function, e.g. we are currently analysing the molecular origin of porcine hernia inguinalis and scrotalis. Using a whole genome scan we have identified several chromosomal regions that are linked to this disorder. Fine mapping, positional cloning and candidate gene analysis are used for further elucidation. However, in recent years we have also started to look at genes in other species, e.g. cattle, dog, sheep, and buffalo. Especially, in cattle, we are interested in the molecular analysis of bovine spongiform encephalopathy (BSE). The differences in oral uptake of prion protein between cattle and pig is studied in vivo and in vitro. We have identified humoral microvesical encapsulated nucleic acids that are altered during a prion infection and can be used as diagnostic tool. Humoral nucleic acids are also studied in several other diseases, e.g. liver carcinoma in dog and pancreatic neoplasias in cat.

Selected Recent Publications

Major Research Interests

Research in the Department of Molecular Neurobiology focuses on the molecular mechanisms of synapse formation and function in the vertebrate central nervous system. Typically, synapses are formed between cellular processes of a sending and a receiving nerve cell. They are the central information processing units in the vertebrate brain where some $10^{12}$ nerve cells are connected by $10^{15}$ synapses to form an elaborate and highly structured neuronal network that is the basis for all forms of behavior. Signal transmission at synapses is mediated by the regulated release of signal molecules (neurotransmitters) which then diffuse to the receiving nerve cell and change its physiological state. In the Department of Molecular Neurobiology, we combine biochemical, morphological, mouse genetic, behavioural, and physiological methods to elucidate the molecular basis of synapse formation and transmitter release processes. Our synaptogenesis research concentrates on synaptic cell adhesion proteins and their role in synapse formation. Studies on the molecular mechanisms of neurotransmitter release focus on components of the presynaptic active zone and their regulatory function in synaptic vesicle fusion.

- Postdoctoral fellow, Princeton University, USA, 1993 - 1996
- Group leader, University of Marburg, 1997 - 2004
- Professor of Molecular Oncology, University of Southern Denmark, Odense, since 2004
- Head of the Department of Molecular Oncology, Georg-August-Universität Göttingen, since 2005

Major Research Interests

We are focusing our research on the tumor suppressor p53, trying to elucidate its mechanisms of action, its regulation and its suitability as a target for cancer therapy. p53 operates as a transcription factor and prevents uncontrolled cell proliferation. This activity is regulated through a sophisticated regulatory network that responds to DNA damage. Despite our knowledge concerning the molecular biology of p53, an integrated concept of its regulation, and its translation into rational diagnostics and therapy, are still in their infancy. The tumor suppressor gene TP53 is mutated or deleted in approximately 50% of malignant tumors. However, this does not mean that p53 is active in the remaining cases. It appears that in the vast majority of the remaining 50% of tumors, p53 is inactivated through malfunction of its modulators, such as Mdm2, p14ARF, deltaNp73, and others. We are therefore pursuing the unique opportunity to re-establish p53's "dormant" tumor-suppressive activity by targeting its modulators as a potential avenue to therapy.

Professor of Biochemistry

- MD, 1967, University Saarland Medical School
- Postdoc at the Universities of San Francisco (UCSF) and Marburg
- Professor of Biochemistry, 1987, University of Göttingen
- Head of the Department of Molecular Biology at the Institute of Biochemistry and Molecular Cell Biology

Major Research Interests

The main interest of the laboratory is in the structure, function and regulation of synthesis of nuclear proteins including chromosomal proteins and other protein factors involved in the control of transcription. DNA replication during the S-phase of the cell cycle requires the coordinate synthesis of histones (H1, H2A, H2B, H3 and H4) in stoichiometric amounts for the assembly of chromatin on replicated DNA. The major human histone gene cluster has been mapped to chromosome 6p21.1-6p22.2, and more than 50 histone genes were identified and sequenced within that gene cluster. Several S-phase independent histone genes (replacement histone genes) map as solitary genes to other chromosomes. Current work in this project area deals with the function and regulation of expression of individual histone subtype genes. A second major project deals with the factors mediating the transport of histones and histone-related transcriptional regulators from the cytoplasm to the cell nucleus. This work concentrates on the differential role of nuclear import receptors and specific protein-protein interactions during the nuclear transport of these proteins. The third topic of research deals with the structural transitions of chromatin during programmed cell death and with the regulation of factors involved in apoptotic chromatin cleavage and histone modification.

Major Research Interests

Our research is focused on the molecular analysis of normal human variability and genetic disturbances of development and differentiation. Isolated genes are being analysed in detail with respect to their functional properties by animal models (transgenic and knock-out mice). For suitable genetic diseases therapeutic strategies (substitution; gene therapy) are being developed and initial evaluation of such strategies is done in the mouse. - We are working on the genotype – phenotype correlations in neurological and cardiovascular diseases (e.g. Spastic paraplegia, Rett syndrome, mental retardation by subtelomeric microdeletions, molybdenum cofactor deficiency; cardiomyopathies, Noonan syndrome) and several genetically determined malformation syndromes (e.g. Townes-Brocks syndrome, Okihiro syndrome, Morbus Osler). - One main interest in our institute is the analysis of structure, expression and function of genes involved in differentiation of male gametes. The knowledge of the function of those genes can help us to clarify the genetic causes of male infertility. We have started to study differentiation capacity of tumor cells, e.g. teratocarcinoma cells, and succeeded to differentiate these cells into spermatogonial stem cells. When transplanted into tubuli of the testis, these cells differentiate into functional spermatozoa.

Major Research Interests

Plant Metabolic Pathways: Our laboratory is currently studying the primary metabolism of plants with main focus on the metabolism of lipids. For this purpose, different approaches ranging from analytical chemistry to biochemistry and molecular biology were used.

Plant Lipid Metabolism: We are interested in physiological functions of specific lipoxygenases, i.e. their involvement in the degradation of storage lipids during germination and in the destruction of organelar membranes during stress. Another research topic is the analysis of their catalytic mechanism. In addition, lipid peroxidation reactions were analysed in general by metabolomic approaches and by studying the biosynthesis of aldehydes (fruit aromas), hydroxy fatty acids and divinyl ether fatty acids (plant defence). Moreover, enzymes which introduce new functionalities (i.e. conjugated double bonds) in the fatty acid backbone were isolated and characterized in order to obtain new seed oils for biotechnological and medical purposes. In relation to that we are manipulating the primary metabolism and organelle development of seeds in order to increase the oil content of seeds.

Metabolic transport processes: Another research topic is the analysis of the mechanism and regulation of transport processes across the peroxisomal membrane. The biochemistry of phosphoinositides and the transfer of enzymes facilitate the metabolic pathways for lcPUFAs from donor organisms into plants.

- Appointed 2001 as Head of the Department of Molecular Structural Biology at the University of Göttingen

Major Research Interests

In order to understand the relationship between the three-dimensional structure and the cellular function of biological macromolecules we determine the structures of proteins and protein-RNA complexes by means of X-ray crystallography. Our current projects concern proteins involved in the splicing and modification of RNA and, as well, proteins required for the nucleocytoplasmic transport, and enzymes of the polysialic acid metabolism.

Selected Recent Publications

Major Research Interests

The interest of our group in the biogenesis of lysosomes is stimulated by the existence of a spectrum of congenital disorders in man that affect the function of lysosomes. Our work includes the identification of new molecular defects in human congenital disorders. Transgenic mice are generated to study the function of lysosomal proteins and proteins involved in lysosome biogenesis and used as models for human congenital disorders for the study of the pathophysiology and the effectiveness of new therapeutic approaches. A number of studies have focused on the identification of lysosomal trafficking signals in membrane proteins, and their recognition by the transport machinery. Current projects focus on the regulation of the interaction of cytoplasmic adaptors with the lysosomal transport signals in membrane proteins, the function of several major lysosomal membrane proteins, a novel protein modification that is required for the catalytic activity of sulfatases and deficient in a human disease and the molecular defects and pathophysiology of a new group of human congenital disorders in which the N-glycosylation of glycoproteins is defective.

Major Research Interests

Chromatin is the physiological template of genetic information controlling the capacity of a cell’s genome to store, release, and inherit biological information. The fundamental unit of chromatin is the nucleosome: a stretch of DNA wrapped around a core of histone proteins (H2A, H2B, H3 and H4). Post-translational modifications of histones have emerged as key for regulating chromatin structure and are thought to crucially control chromatin dynamics and genome activity. Whereas more and more histone modification marks are being identified that alone or in combination could mediate distinct biological conditions of a cell and while correlative studies have begun to establish unambiguous links between several states of chromatin, various histone modifications, and diverse biological processes, our knowledge of how certain histone modifications exert their biological effects on a molecular/biochemical level is still very limited.

Due to their long-term stability, histone lysine methyl-marks are of particular interest to us, since they might be involved in establishing and maintaining durable and inheritable gene expression profiles (so called ‘epi-genetic’ regulation). Current projects include the study of Polycomb, HP1, and MBT proteins that bind to and act as effectors of distinct histone lysine methyl-marks. We are especially interested in the interplay of these factors and their cognate histone marks in regulating chromatin organization and dynamics. Furthermore, we are trying to identify and characterize novel binding proteins of various other histone modifications.

The long-term goal of our research is to gain mechanistic insight(s) into the signaling mechanisms and biological role of single but also combinations of histone modification marks and to understand how certain states of chromatin regulate the functionality of a cells genome. To this end, we aim to reconstitute chromatin-signaling pathways in recombinant and cell free systems and study their epi-genetic regulatory circuits in various biological model systems (i.e. Xenopus laevis, mice, tissue culture).

Major Research Interests

Plants are constantly exposed to attack by pathogenic microorganisms like fungi, viruses and bacteria. To combat these infections, plants have evolved efficient defense responses, many of them requiring induction of gene expression. A particularly interesting phenomenon is the systemic acquired resistance (SAR). If a pathogen is recognized by a specific plant resistance machinery, hypersensitive cell death occurs at the site of the infection, which limits spread of the pathogen. Subsequently, levels of salicylic acid (SA) rise throughout the plant. SA is sufficient and necessary to induce a subset of defense gene, which leads to resistance against a broad range of pathogens, which would normally be highly infectious. We are interested in the transcriptional regulation of defense genes by SA. We have isolated transcription factors whose activity is regulated by SA by a yet unknown mechanism. We are addressing the question of regulation using genetic, molecular and biochemical tools.

The second project deals with "indirect defense" mechanisms of plants against insects. When insects feed on plants, plants emit volatiles to attract the enemies of the insect. We are interested in the transcriptional regulation of biosynthetic genes leading to the synthesis of volatiles.

Major Research Interests

Our group focuses on the structure and dynamics of biomolecules and their complexes. We use to this end nuclear magnetic resonance (NMR) spectroscopy as well as X-ray crystallography. We apply solution state and solid state NMR spectroscopy to biomolecules and their complexes in their physiological environment, be it water for cytosolic proteins or lipids for membrane proteins. The methods developments are pursuing the following goals:

- Relaxation compensated methods to increase the molecular weight of biomolecules that are amenable for NMR investigations. This is tackled by new NMR pulse techniques, novel schemes for labelling the biomolecules with isotopes and the usage of optimized expression schemes. New NMR derived parameters that allow to define biomolecular structure and dynamics better are derived and applied e.g. to DNA binding proteins, spliceosomal RNA, a bacterial sensor and proteins involved in signal transduction and apoptosis and for the investigation of enzyme mechanisms.
- Development of NMR methods to assign and determine the structure of isotopically labeled membrane-proteins and peptides with solid state NMR spectroscopy on oriented samples or using magic angle sample spinning on several systems including a 150 kD membrane-Protein and the complex of a peptide and a G-protein coupled receptor.

Selected Recent Publications

Major Research Interests

The protozoan parasite *Toxoplasma gondii* usually causes asymptomatic infections in immunocompetent adults leading to lifelong persistence especially in the brain and in muscle tissue. Life-threatening reactivation of such infection might occur in immunocompromised individuals (i.e., patients suffering from AIDS). This parasite serves as a model organism for studying evasion mechanisms of intracellular pathogens.

We are interested in the cross-talk between the parasite and its host cell on a molecular level. We could demonstrate that the parasite (i) modulates the host cell capacity for MHC-restricted antigen presentation and (ii) inhibits apoptosis of the infected cell. Both mechanisms allow intracellular persistence. Vice versa, the host's immune response determines the fate of the parasite by direct interference with differentiation processes of *Toxoplasma gondii*. The precise molecular events for these strategies of intense interplay between both partners are currently under our investigation.

Recently, we as well have started to analyse host-pathogen crosstalk of *Chlamydia pneumoniae* in order to compare the pathogenesis of intracellular eukaryotes with those of procaryotes. In this respect, we concentrate on the type III secretion system of *Chlamydia* which by injecting effector proteins into the cytosol of its host cell is able to modulate important functions such as antigen presentation and apoptosis.

In addition, we are appointed the National Reference Center for Systemic Mycoses. In this respect, we are investigating fungal factors and mechanisms that are involved in pathogenesis of mycoses; i.e., cell wall structure and differentiation processes.

Major Research Interests

Hedgehog (Hh) signaling molecules play a key role in the patterning of numerous tissues during development. Hh signaling is initiated by binding of Hh to its receptor Patched (Ptc). This binding suspends the inhibitory action of Ptc on its signaling partner Smo. Smo is activated and the signaling pathway is turned on. The pathway can also be activated by mutational inactivation of Ptc or by activating mutations in either Hh or Smo and we were able to show that this pathological activation results in developmental defects and in tumor formation in humans and mice.

The goal of our group is to characterize the role of the Hh signaling pathway in the diseased state by identification of its cellular targets and by characterization of its interaction with other signaling pathways. This is achieved by the application of modern genetic techniques (e.g. microarray analysis) to human and murine tumors and cell lines with mutations in one or more components of the pathway. This approach should help to develop molecular diagnostics for Hh-related malignancies as well as to identify targets for therapeutic interventions.

**Major Research Interests**

How is the embryo generated from a single cell, the egg? We address this question by using the *Drosophila* embryo as an experimental system, applying the combined tools of classical embryology, genetics, molecular biology and biochemistry. We have focussed our efforts to isolate and characterize the factors underlying early pattern formation along the anterior-posterior axis of the embryo. We sought to unravel their mode of action and the molecular mechanism in which they function.

Many of the factors required to establish the basic body plan are also necessary for organ formation, a process which involves local inductive interactions between groups of cells and/or epithelial cell layers. We have started to identify the genetic components and regulatory circuitries involved in organogenesis as well as in neural conductivity and function. We also use the fly to identify the components of novel biochemical pathways and cellular key components that control and maintain homeostasis and energy balance, and we initiated a gene discovery program to systematically characterize the function of genes on the *Drosophila* X-chromosome.

**Selected Recent Publications**

Major Research Interests

Our group is interested in the mechanisms of membrane fusion, with the main emphasis on regulated exocytosis in neurons. Since recent years it is known that intracellular membrane fusion events are mediated by a set of conserved membrane proteins, termed SNAREs. For fusion to occur, complementary sets of SNAREs need to be present on both of the fusing membranes. The neuronal SNAREs are among the best characterized. They are the targets of the toxins responsible for botulism and tetanus. To understand how these proteins make membranes fuse, we studied their properties in detail using biochemical and biophysical approaches. We found that they assemble into a tight complex which ties the membrane closely together and thus probably initiates bilayer mixing.

In our current approaches, we study membrane fusion at the level of isolated proteins as well as in semi-intact and intact cells. Thus, we are investigating conformational changes of the SNARE proteins before and during fusion. Furthermore, we use reconstitution of membrane fusion in cell-free assays and in proteoliposomes. Other projects of the group include the study of neurotransmitter uptake by synaptic vesicles and the function of Rab-GTPases in neuronal exocytosis.

Major Research Interests

The group studies patterning processes in early chick and mouse embryos, in particular during gastrula and neurula stages. The primitive embryonic ectoderm, the epiblast, gives rise to the three germ layers, the definitive ecto-, endo- and mesoderm, which interact during the transition from pattern formation to organogenesis. We study these processes by applying molecular and embryological techniques, including expression analysis, transplantation in embryo culture, large scale screening of expressed sequence tags, in vivo gene transfer by electroporation, and gene knock-out technology.

We identified the Geminin protein as a mediator between cell cycle progression and the control of axial specification. Geminin interacts with homeodomain proteins of the Hox family and inhibits their binding to DNA and their function as transcriptional activators. In addition, Geminin is a transient member of the Polycomb complex, where it is involved in the maintenance of Hox gene repression. Our goal is an understanding of the coordination between proliferation and pattern formation.

Selected Recent Publications

Major Research Interests

The long-range transport of membrane organelles in neurons depends primarily upon microtubules and motor proteins that move unidirectionally along these tracks. One type of microtubule-based motor proteins powering membrane transport is the kinesin superfamily. We are interested in how these motors achieve specificity in cargo binding, elicit membrane transport, and the regulation of transport activity. One example of a kinesin motor is UNC-104/KIF1A, which specifically transports presynaptic vesicle to the synaptic terminal and binds with its tail domain directly to membrane lipids in vitro. This unique cargo-interaction mechanism help us to understand how lipids and their membrane environment contribute to cargo transport, how motor-lipid interaction could be regulating transport, and how accessory proteins contribute to membrane motility. Using fluorescently tagged motor and vesicle markers we investigate these questions in the nervous system of the nematode C. elegans serves us as a model system for microscopic tools (confocal, TIRF, FRET FLIM) and biochemical transport assays in vitro.

Major Research Interests
The main interest of the laboratory is in the molecular mechanisms of gene transcription. Transient transfections of reporter fusion genes, transgenic mice, and other molecular biology techniques are used to study the mechanisms of cell-specific and signal-induced gene transcription, and how drugs interfere with these mechanisms to produce pharmacological effects. 1. The pancreatic islet hormone glucagon is a biological antagonist of insulin and regulates blood glucose levels. Enhanced synthesis and secretion of glucagon contributes to increased hepatic glucose output and hyperglycemia in diabetes mellitus. We study the mechanisms which activate the glucagon gene in pancreatic islet a cells as well as signaling pathways to the glucagon gene induced by cAMP, membrane depolarization, and insulin. 2. We study the regulation of glucagon gene transcription by the new group of oral antidiabetic drugs, the thiazolidinediones. These so-called ‘insulin sensitizers’ may improve insulin action in part through an effect on glucagon. 3. The ubiquitously expressed, cAMP- and calcium-regulated transcription factor CREB is affected by several classes of drugs. We study how the immunosuppressive drugs cyclosporin A and FK506 (tacrolimus) inhibit CREB-mediated transcription. This effect may underlie their pharmacological effects, both desired and undesired. Using transgenic mice and an animal model of depression, we also study whether treatment with antidepressants alters CREB-mediated transcription in order to better understand the molecular mechanisms of action of antidepressant drugs.

Major Research Interests

Besides being fast and highly accurate, the most important demand on replication of DNA is that it has to be completed. While this may sound trivial on first glance, many obstacles like protein-DNA complexes and damaged nucleotides on the template strand can prevent replication fork progression. It is estimated that at least one fork arrest occurs per replication round in E. coli. Therefore, all organisms analysed so far in detail possess several pathways to reactivate stalled replication forks. We discovered that the baker’s yeast Mph1 protein defines a hitherto unknown pathway for replication restart, which is apparently also operating in higher eukaryotes including humans. One question we are interested in is the exact mechanism, by which this pathway works. We are also interested in positioning this pathway within the complex cellular network of replication reinitiation mechanisms, where two principle possibilities for fork reactivation can be found: one being quite safe, but acting on the expense of replicational fidelity, whereas the other is error-free, but bears the inherent danger of genomic rearrangements. Therefore, we are also interested in the regulatory mechanisms that guide the choice of the cell for one or the other possibility as well as the conditions that are sensed by the regulatory proteins.

Selected Recent Publications

Major Research Interests

The nervous system is a complex network of billions of neurons building appropriate connections and transmitting the information required. Although the nervous system has a lifelong synaptic plasticity, it is essentially built just once with very little regenerative capacity, meaning that neurons have to survive and function for lifetime. Loss of neurons will eventually lead to functional impairments such as those found in Alzheimer’s, Parkinson’s or ALS patients.

We are interested in the understanding of the regulation of neuronal survival and death. Recent advancements in the field have provided clear evidence that neuronal survival is caused by synergistic actions of neurotrophic factors along with other cytokines most prominently from the TGF-β superfamily. Synergisms of TGF-β in combination with neurotrophic factors, like GDNF or NGF, will be studied to establish their role in nervous system development and their therapeutic potential in brain repair. Specifically, we shall investigate such synergisms by utilising mouse mutants to understand the developmental role and by employing genomic screens to identify new target genes for the establishment of new therapeutic strategies for human neurodegenerative disorders. Furthermore, as growth factors function not only in the decision of neuron survival or death, we shall explore their morphogenetic and differentiation capacities employing the powerful potential of embryonic (ES) and CNS stem cells.

Selected Recent Publications

Major Research Interests

One of the main interests of our group is the analysis of polysaccharide and oligosaccharide breakdown and utilization by microorganisms adapted to extreme habitats. In particular, we are interested in cellulose, xylan and starch degrading enzyme systems from hyperthermophiles, i.e. organisms that grow optimally at 80°C or higher. These organisms represent very deep branches within the prokaryotic lineages of the phylogenetic tree of organisms. We are interested in the biochemical properties, the molecular structure and catalytic mechanism, the function(s) of non-catalytic domains, and the cellular localization of unusual glycosyl hydrolases and transferases from Thermotoga maritima, the model organism of hyperthermophilic bacteria. Other projects in the field of extremophilic microorganisms deal with the enzymology and molecular biology of thermoalkaliphiles and thermoacidophiles. We have completed the genome sequence of the extreme thermoacidophilic archaeon Picrophilus torridus with the objective to better understand the evolutionary, metabolic and molecular mechanisms that allow this organism to thrive at up to 65°C at pH values close to pH 0.

Another group of bacteria studied in the laboratory are the Gram-positive bacteria with a high G+C content. We employ molecular biological techniques to study and modify physiological traits of amino acid-producing corynebacteria and micrococci. Also, the group is interested in the characterization of genome (metagenome) structures of various microbial habitats (PD Dr. R. Daniel). DNA libraries are constructed from microbial consortia and biofilms in order to explore the genetic diversity of the different environments. Also, classical activity-based screens are used for the isolation of novel enzymes useful for biotechnology.

Major Research Interests
Pre-mRNA splicing, the excision of non-coding introns to generate mature mRNA, is
an essential step in gene expression. The human genome is much smaller than ex-
pected based on the complexity of the human proteome, and alternative splicing,
whereby different mRNAs (and thus functionally distinct proteins) are generated from
a single pre-mRNA, plays a critical role in expanding our genetic capacity. Splicing is
catalysed by the spliceosome, a large ribonucleoprotein complex formed by the inter-
action small nuclear ribonucleoproteins (snRNPs U1, U2, U4/U6 and U5) and more
than 100 proteins with the pre-mRNA. Spliceosome assembly and catalytic activation
proceed sequentially via several intermediate complexes that differ in composition and
in the interactions between their components. The spliceosome is thus highly dynamic,
undergoing major structural changes during its assembly and catalytic action. We are
pursuing two major goals: (i) to understand how spliceosomes specifically recognize
and bind introns, and discriminate them from exons, and (ii) to structurally and mecha-
nistically dissect the catalytic core of the spliceosome to determine whether it is a
ribozyme or whether proteins also function in catalysis. As a prerequisite, we have established novel affinity-based methods to isolate and
study spliceosomal complexes at defined functional stages (e.g. pre-catalytic and cata-
lytically activated spliceosomes). These methods, as well as RNA structure probing
and site-directed crosslinking techniques, combined with high throughput mass spec-
trometry are being used to chart the dynamics of the RNA-RNA, RNA-protein and
protein-protein network of the spliceosome during its action cycle. The role of
spliceosomal proteins in spliceosome assembly and in promoting the formation of the
catalytic core is being investigated by RNA interference and biochemical methods.
In addition, we are investigating the 3D structure of spliceosomal complexes using high
resolution cryo-electron microscopy and x-ray crystallography.

My group is also interested in the cell biology of the splicing machinery. Specifically we
are investigating the role of sub-nuclear compartments such as “cajal bodies” in the
assembly, transport and recycling of spliceosomal snRNPs, using microinjection to-
gether with RNA interference, and high resolution light microscopy techniques.

Molecular mechanisms of mammalian development and stem cell biology

In order to understand the molecular mechanisms governing mammalian development, we are using the mouse as a model system. We are focusing on the role of transcription factors in development. Using embryonic stem cells mouse loss-of-function mutants were generated. Specifically, we have shown that Pax and homeobox-containing genes are required for early decisions in organogenesis and cell differentiation. In addition, we are currently taking advantage of the in vitro differentiation potential of embryonic stem cells to search for molecules that are involved in dopaminergic neuron induction, differentiation, and/or survival.

Major Research Interests

Research in our group centers around posttranslational modification with small ubiquitin-related proteins of the SUMO family. SUMO proteins are ubiquitously expressed in eukaryotic cells, and are essential for life. They are reversibly coupled to a large number of cellular targets, and thereby modulate protein / protein or protein / DNA interactions, alter intracellular localization, or protect from ubiquitin mediated degradation. Higher organisms often express several distinct SUMO proteins (e.g., three in humans). Those are conjugated to different targets under normal growth conditions, or conjugated preferentially upon stress. Most of the known targets for sumoylation can be associated with a few specific pathways: signal transduction, transcription, chromatin remodelling, DNA repair, mitosis, viral infection, and nucleocytoplasmic trafficking. Projects in the lab aim to understand basic mechanisms, regulation, and function of SUMOylation in mammalian cells. This involves, e.g., characterization of SUMO enzymes, analysis of SUMO conjugation under stress conditions, and the identification and characterization of novel SUMO targets. Special emphasis is also given to the interplay between SUMOylation and nucleocytoplasmic trafficking.

Major Research Interests

The focus of our work is on algorithm development for nucleic acid and protein sequence analysis. We are particularly interested in multiple sequence alignment and gene prediction; the software programs DIALIGN and AUGUSTUS are developed and maintained by our department.

In recent years, alignment of large genomic sequences became a powerful tool for genome analysis and annotation. Cross-species alignment of genomic sequences has been used for gene prediction, to detect regulatory sites or to identify signature sequences for pathogen microorganisms. We are developing novel alignment approaches that combine sensitivity and speed for long-range genomic alignment. These approaches are also used to improve our gene-finding software tools.

Other areas of interest include phylogeny reconstruction, RNA structure analysis and motif discovery using machine-learning approaches.

Major Research Interests

We are interested in the mechanisms of neuron-glia interactions in the higher nervous system, and in the genes that are required for normal glial cell function. Here, transgenic and mutant mice have become important to study developmental processes as well as genetic diseases. For example, oligodendrocytes are glial cells highly specialized for wrapping CNS axons with multiple layers of membranes, known to provide electrical insulation for rapid impulse propagation. We found that oligodendrocytes are also essential for maintaining the long-term integrity of myelinated axons, independent of the myelin function itself. The mechanisms by which oligodendrocytes support long-term axonal survival are still under investigation. The importance of glial cells as the "first line of neuroprotection", however, is illustrated by several myelin-associated diseases in which axonal neurodegeneration contribute to progressive disability. These range in humans from peripheral neuropathies (CMT1) to spastic paraplegia (SPG2), and presumably multiple sclerosis (MS) and certain forms of psychiatric disorders. We are developing transgenic animal models for some of these diseases, in order to dissect the underlying disease mechanisms and, in the case of CMT1A, have used these models to design novel therapeutic strategies.

The glial "decision" to myelinate an axonal segment is partly controlled by the axon itself, but the signaling mechanism is not understood. We have found that axonal neuregulin-1 (NRG1) is the major determinant of myelination in the peripheral nervous system. We are now investigating NRG1 dysregulation also in CNS myelination, using quantifiable behavioural functions in mice. By combining genetics with environmental risk factors for schizophrenia (in collaboration with H. Ehrenreich) we will explore the hypothesis that NRG1, a known human schizophrenia susceptibility gene, points to an important role of myelinating glia in some psychiatric disorders.

Future Projects and Goals

Mechanisms of neuron-glia signalling; function of myelin proteins and lipids; transcriptional profiling of single cells in vivo; novel mouse models of neuropsychiatric disorders.

Major Research Interests

Molecular Mechanisms of Exocytosis, Neurotransmitter Release, and Short Term Synaptic Plasticity

In order to understand how the brain handles its information flow and adjusts synaptic connections on the second and subsecond timescale, one has to understand all aspects of synaptic transmission ranging from availability of vesicles for exocytosis, presynaptic electrophysiology, Ca++ signalling, the process of exocytosis, and postsynaptic neurotransmitter action. Our work concentrates on presynaptic aspects. We study the basic mechanisms of exocytosis, using adrenal chromaffin cells as a model system and the patch-clamp method. This work, in which intracellular Ca++ is manipulated (caged Ca++) and measured on the single cell level aims at understanding the role of specific synaptic proteins in the maturation and exocytosis of secretory vesicles. We use neuronal cell cultures and brain slices for studying mechanisms of short term plasticity, such as depression and paired pulse facilitation. The Calyx of Held, a specialized synapse in the auditory pathway, offers unique possibilities for simultaneous pre- and postsynaptic voltage clamping. This allows a quantitative analysis of the relationship between [Ca++] and transmitter release.

Major Research Interests

The differentiation of complex organisms has its origin in the asymmetric distribution of regulatory proteins or of the corresponding mRNAs in the egg, as well as in a complex system of cell/cell communication events via extracellular signalling molecules during early stages of embryogenesis. The genes that encode for these different activities form functional networks which provide the basis for the genetic programming of embryonic development. Our primary research interest is in the identification of such regulatory genes and networks in vertebrates, as well as in the definition of their regulation and function on the molecular level. For this purpose, we use Xenopus laevis, a frog from South Africa, as a model system. As a traditional object in experimental embryology and in comparison with other experimental systems such as the mouse, use of Xenopus offers a number of practical advantages. Oocytes and embryos are easy to collect in large numbers, they are easy to manipulate by relatively simple techniques, also because embryonic development proceeds in the petridish, and, more recently, it has even become possible to generate hundreds of transgenic frogs within a single experimental day. The research topics that we are focussing on are:

- Transport and function of vegetally localized maternal mRNAs
- Organogenesis: formation of pancreas and liver in vertebrate embryos
- Early neural development: primary neurogenesis

Major Research Interests

We are using the zebrafish system to study the molecular mechanisms of cell migration and cell fate maintenance, two processes that are central for animal development (e.g. organogenesis) and are highly relevant for pathological conditions (e.g. cancer and inflammation).

Similar to other organisms, the primordial germ cells (PGCs) of zebrafish originate at positions that are distinct from the position where the gonad develops. Therefore, during early development the cells migrate through the embryo towards their target where they differentiate into sperm and eggs. During their migration the cells have to obtain directional cues from surrounding tissues and maintain their cellular identity. The molecular nature of the directional signals was revealed in a screen in which the chemokine receptor CXCR4b and its ligand SDF-1a were identified. SDF-1a is expressed in tissues towards which the PGCs migrate. Conversely, knocking down CXCR4b or SDF-1a leads to loss of directional migration resulting in random distribution of the PGCs within the embryo. Currently, we are analyzing the molecular mechanisms downstream and upstream of the receptor that transform the signal into directional cell movement. In addition, we are studying the molecular mechanisms of PGC fate maintenance and motility by analyzing the function of a number of molecules whose function is essential for normal PGC behaviour and development.

Major Research Interests

Structural Aspects of Vesicular Transport

The research focus of the lab is on the structure and function of proteins involved in the regulation of vesicular transport of proteins in eukaryotic cells. X-ray crystallography is used to accurately determine the static structure of these proteins and their complexes. In addition, steady-state fluorescence and absorption spectroscopy are employed to gain thermodynamic and kinetic insight into the system under study. Both, structural and thermodynamic methods complement each other ideally to yield a more complete picture of the regulation processes involved in protein sorting than is possible from either approach alone. To accomplish our goals, a broad knowledge in molecular biology, biochemistry, spectroscopy, crystallography, and computational biology is vital.

Major Research Interests

Branched tubular networks are a fundamental structural design of many organs including lung, vascular system and kidney. Critical for organ function, i.e. the transport of fluids or gases, is the proper size and diameter of the tubular branches as well as an elaborated network formation. How do these networks develop? How do the branches grow out, detect their fusion partners and interconnect? How are tube size and diameter controlled? How can the system respond to different physiological needs? How do epidermal sheets control the paracellular passage of solutes?

We investigate the development of the Drosophila tracheal (respiratory) system since it provides an ideal model to address such questions, because of its simple stereotypic architecture, accessible genetics and molecular tools.

Major Research Interests

Interested in methods of solving and refining crystal structures (both small molecules and proteins) and in structural chemistry.

Holy Grail: the Crystallographic Phase Problem. If only there was an easy way of measuring the phases of X-ray reflections as well as their intensities, crystal structures could be determined directly. At resolutions of better than about 2.5Å, there are more measured intensities than atomic coordinates, so the problem is overdetermined and there should be a solution. Recently we were able to increase the size of structures that can be solved from the intensity data alone by ‘ab initio direct methods’ from about 200 to 1000 unique atoms, given data to ‘atomic resolution’, but most interesting macromolecular structures are still out of the reach of such methods. Indirectly however the same techniques are proving very useful for the solution of large macromolecular structures when a little starting phase information is available, e.g. by incorporating heavy atoms into the crystal.

Major Research Interests

Our group is interested in the regulation of carbon and nitrogen metabolism in Gram-positive bacteria. We are following global (“post-genomic”) and gene-specific approaches. Metabolism in *Bacillus subtilis* is studied by transcriptomics, protein arrays, and metabolome and fluxome analyses. Our specific interests are focussed on two key pathways: glycolysis and glutamate biosynthesis, the decisive link between carbon and nitrogen metabolism. We are studying three regulatory mechanisms of glycolysis: a controlled protein-RNA interaction, site-specific mRNA degradation and proteolysis. We discovered recently that genes for glutamate biosynthesis in *B. subtilis* are only expressed if rich carbon sources are available and we identified a regulatory protein-protein interaction that govern this sugar induction.

In another project, we study the regulation of gene expression in the pathogenic bacterium *Mycoplasma pneumoniae*. This is highly interesting because this bacterium is an important cause of pneumonia. Moreover, *M. pneumoniae* is one of the organisms with the smallest genetic equipment that is capable of independent life. Understanding *M. pneumoniae* means understanding life! So far, we have studied one of the few regulatory proteins of *M. pneumoniae* and determined its crystal structure. Interestingly, the mode of action of this protein is opposed to that of homologous proteins from other bacteria: a hint to the parasitic lifestyle of *M. pneumoniae*! We are now starting to study the metabolic responses of *M. pneumoniae* to the infection process. If we understand what happens upon infection, we may subsequently try to interrupt this chain of events.

Major Research Interests

We are studying the molecular mechanism of autophagy in the yeast *Saccharomyces cerevisiae*. Autophagy is a starvation induced transport pathway, which delivers cytosolic material for degradation to the lysosome (vacuole). It is highly conserved in all eukaryotes from yeast to human and helps the cells to survive periods of nutrient limitation. Autophagy further plays an important role in ageing, the development of breast cancer and cardiomyopathy and it was linked to neurodegenerative diseases like Alzheimer’s, Huntington’s and Parkinson’s disease. Autophagy is mechanistically unique, since its transport intermediates, the autophagosomes, are surrounded by two individual membranes. It starts at the newly-discovered preautophagosomal structure, where autophagosomes are formed. Autophagosomes unspecifically enclose parts of the cytoplasm including organelles like mitochondria, peroxisomes and parts of the ER. When the autophagosomes reach the vacuole, their outer membrane-layer fuses with the vacuolar membrane and a still membrane-enclosed autophagic body is released into the vacuolar lumen. In the vacuole autophagic bodies are lysed and broken down together with their cytosolic content.

The intravacuolar breakdown of autophagic bodies requires the selective lysis of their limiting membrane. The intracellular lysis of a membrane is a very interesting feature of eukaryotic cells and implies a high risk for cellular integrity. In a genetic screen, we identified Aut5 as an essential component of this lysis process. We found that Aut5 is an integral membrane protein and that its lipase active site motive is essential for lysis of autophagic bodies.

Major Research Interests
The three major steps of gene expression, transcription, pre-mRNA splicing and translation, are carried out by multi-component enzymes, which are, respectively, the RNA polymerases, the spliceosome and the ribosome. In addition, the catalytic cycles of these molecular machines are guided or modulated by large numbers of auxiliary factors. Our research group uses X-ray crystallography to study in atomic detail structures of proteins, RNAs and macromolecular complexes, which are part of these gene expression machineries. Along one strategy, we attempt to explore recombinantly produced individual components and lower order assemblies. Another goal is the investigation of natively purified spliceosomal small nuclear ribonucleoprotein particles (snRNPs), snRNP aggregates and multi-component sub-complexes of the snRNPs. The work on pre-mRNA splicing is conducted in close cooperation with the laboratory of R. Lührmann.

- Head of Department of Primate Genetics, German Primate Center, Göttingen, since 2004
- Habilitation (Immunology and Immunogenetics), Medical Faculty of the University of Göttingen, 2005

Major Research Interests

The main interests of the laboratory are immunology, the genetic control of immune responses, functional genomics, molecular evolution, and population genetics. The research is focussed on the functional, evolutionary, and genomic analysis of genes of the major histocompatibility complex (MHC) as well as the natural killer cell receptor and leukocyte receptor complexes (NKC, LRC). The analyses are carried out in various organisms that are used as models of human diseases such as certain nonhuman primates (rhesus macaque, common marmoset) and rodents (mouse, rat). Functional studies aim at elucidating the role of certain genes of the MHC, NKC, and LRC in innate and adaptive immunity.

In a further research focus, the molecular evolution and population genetics of various nonhuman primate taxa are analyzed on the basis of molecular data. These studies aim at clarifying the phylogenetic relationship of various primates (molecular phylogeny) and to determine their geographic distribution (phylogeography), particularly of highly endangered primate species (conservation biology).

Major Research Interests

The signature structure of B lymphocytes is their clonotypic antigen receptor (BCR). Our major research focuses on the elucidation of intracellular BCR signaling pathways that regulate the development and activation of B cells in health and disease. We have identified enzymatically inert adaptor proteins such as SLP-65 (for: SH2 domain-containing leukocyte adaptor of 65 kDa), which nucleate the formation of multi-molecular protein complexes to integrate and amplify BCR signals. A key function of these signaling modules is to orchestrate the mobilization of the second messenger Ca$^{2+}$. Interference with expression and/or function of one of the signaling components can cause severe immunodeficiencies in mouse and man. Moreover, viruses such as the Epstein-Barr virus (EBV) abuse BCR effector proteins to reorganize signaling cascades for their own benefit. Biochemical and genetic methods, which are applied to study these events in vitro and in vivo, include protein purification by affinity chromatography and immunoprecipitation, analysis of protein interactions, flow cytometry, targeted gene disruption in cell culture and embryonic stem cells followed by reconstitution experiments using electroporation techniques or retroviral gene transfer.

Major Research Interests

A key question in developmental biology is how diverse animal body plans are specified. Early developmental decisions determine the coordinates of the embryo and activate the genetic circuitry that sequentially subdivides and regionalizes the animal body. For insects, only in *Drosophila* the early developmental events are known in molecular detail. However, insects with varied life histories must compensate different reproductive strategies by adjusting the regulatory networks within the developmental program. Therefore, phylogenetic differences between diverse species must be manifested in the genetic circuitries regulating embryogenesis.

To identify the plasticity in early developmental processes, we study their conservation and divergence in different arthropod species. Developmental regulatory genes code for signal transduction molecules and transcription factors. But of equal importance to the coding part of these genes are their cis-regulatory sequences, which serve as integration points for originally distinct signals. By insect transgenesis and functional genomics approaches, we analyze genetic interactions within the regulatory network of early embryogenesis in diverse insect species. This will help us to understand how animal evolution is based on changes in gene regulation governing early pattern formation.

Furthermore we apply our knowledge about developmental processes to insect pest management. Current control efforts rely mostly on insecticides, but the costs for developing new chemical products to overcome the problem of insecticide resistance are escalating. Genetic control based on the sterile-insect technique (SIT) uses the release of sterile males to cause infertile matings which reduce pest population levels. Due to the species specificity, SIT is considered an ecologically safe procedure. However, conventional sterilization by ionizing radiation also decreases the competitiveness of sterilized males. To overcome this problem, we design transgenic approaches to selectively produce vigorous and potent sterile males by generating conditional male sterility in combination with conditional female lethality.

Major Research Interests

At the center of my research interests is the question of how neural stem cells divide asymmetrically to produce another stem cell and a progenitor cell that will differentiate and give rise to neurons and glia cells. One important aspect of asymmetric cell division is the establishment of an intrinsic polarity which is the prerequisite for the asymmetric localization of proteins and mRNAs that serve as cell fate determinants. Our model system for the asymmetric division of stem cells is the embryonic neuroblast of Drosophila. Here we study the function of genes that control cell polarity, asymmetric localization of cell fate determinants and orientation of the mitotic spindle. The knowledge obtained in the Drosophila system has stimulated intense research on the participation of the orthologous genes and proteins in the asymmetric division of vertebrate stem cells.

Major Research Interests

Natural products chemistry and biochemistry

Microorganisms are an important source for novel natural products, such as antibiotics and other active substances. For the isolation of chemically new and biologically active compounds we especially use actinomycetes and fungi imperfect. In the search for new secondary metabolites two approaches have been applied successfully, both, the biological and chemical screening. For the latter we use TLC with different types of staining reagents or HPLC with varying detection methods (UV, MS, CD) to record all metabolites produced in the culture extracts. Most of the strains evaluated were isolated from earth samples and cultivated up to 50-litre fermenters in my group.

The chemical work starts with the isolation and structure elucidation of the novel natural products. Structural problems were solved by using modern spectroscopic methods (e.g. MS, high field 2D-NMR, X-ray analysis). We have established several hundreds of metabolites, which belong to different chemical classes (e.g. peptides, macrolides, quinones, glycosides, polyenes). Further investigations focus on the biosynthesis of the novel compounds, starting with feeding experiments with stable isotope precursors. We are interested in new biosynthetic pathways and try to modify the metabolites by applying the precursor-directed biosynthesis and by changing the cultivation conditions. The biological activity of our metabolites and derivatives is established in different test systems, mostly in cooperation with colleagues and industry.

Major Research Interests

The fruit fly *Drosophila melanogaster* is a model organism that combines sophisticated genetics and well understood development in a small, fast, easy to manipulate package. Our group is using this system to study the components and requirements for the JAK/STAT signal transduction pathway. The JAK/STAT pathway is involved in blood cell production and the immune response in vertebrates and its mis-activation has been implicated in a number of cancers and leukemias. We are following two complementary approaches to better understand this important pathway. Firstly, we are using the genetics of *Drosophila* to identify new components of the pathway and gene products that interact and regulate the pathway. Traditional “forward” genetic screens and tissue culture based RNAi screens are being undertaken. Secondly, the developmental processes that require JAK/STAT signalling are being investigated and characterised. In this way we can hope to better understand what the pathway does and with what other signal transduction pathways it interacts with. The results from this research is being integrated with what is already known to extend our understanding of the pathway.
