Letter from the President

Success for a comprehensive research university such as our Georg-August University of Göttingen is rooted in excellent science and its integration into an optimal learning environment to educate competent and critical young academics. I am very glad that our university in cooperation with the local Max-Planck Institutes and the German Primate Center has been able to establish conditions, which make top interdisciplinary science possible in an international setting enabling us all to feel the Göttingen Spirit.

The two international MSc/PhD programs in Molecular Biology and Neurosciences truly have contributed to our continued strive for excellence in science-oriented training both by integrating faculty members from university and non-university institutes across institutional borders and by providing comprehensive services especially for international students on the Göttingen Research Campus. Based on the proven concepts and the experience of these programs the Göttingen Graduate School for Neurosciences, Biophysics, and Molecular Biosciences (GGNB) was established, which is continuously supported by the federal Excellence Initiative since 2007.

The Molecular Biology and Neuroscience Biology programs remain unique within the Graduate School GGNB in offering integrated MSc/PhD curricula with a fast track option which allow excellent BSc graduates to directly enter the PhD phase after successfully absolving the initial 1st year training phase. For over a decade these international programs have been particularly successful in attracting high numbers of worldwide applicants of good academic quality providing the basis for the selection of the very best candidates. New ideas introduced by these programs have meanwhile been adopted by the Georg-August University School of Science (GAUSS) and other graduate schools for the benefit of the entire university.

While maintaining their successful structure the content and focus of the training curriculum of the programs has continuously been adapted to the changing research topics. Consequently, new faculty members are integrated to reflect novel developments in research. They will further ensure optimal individual supervision and up-to-date research-oriented training. Beyond academia both programs keep close contact with the relevant industries to enhance the opportunities of the graduates for a successful professional career in the private sector.

I would very much like to thank all colleagues and institutions for their committed support of these international programs and, last but not least, the German Academic Exchange Service (DAAD), the Lower Saxony Ministry of Science and Culture, and the various generous donors. The Georg-August University of Göttingen will continue to support these programs to promote international exchange at all levels and for further interaction with our partners worldwide.

Prof. Dr. Ulrike Beisiegel

(Professor of the Georg-August University of Göttingen)
Letter from the Max Planck Society

The mission of the Max Planck Society is to conduct basic research in science and humanities at the highest level. More than 80 Max Planck Institutes are located on scientific campuses across Germany, most of them close to universities.

Scientific ties between Max Planck Institutes and universities are traditionally strong. In 1998, during the 50th year celebration of the Max Planck Society in Göttingen, the Max Planck Society, together with the Hochschulrektorenkonferenz, launched the International Max Planck Research Schools as a new joint program to further intensify cooperation.

The goals of the International Max Planck Research Schools are

- to attract excellent students from all around the world to intensive Ph.D. training programs in Germany, preparing them for careers in science,
- to integrate Max Planck scientists in top-level scientific training of junior scientists,
- to intensify the ties to the universities owing to the participation of internationally renowned Max Planck scientists in joint teaching activities, and
- to strengthen international relationships by providing individual support to each student and by exposing foreign students to German culture and the German language.

By now, 63 International Max Planck Research Schools have been established involving 82 Max Planck Institutes, 37 German universities and 25 universities abroad. About 3150 PhD students from 112 countries are presently enrolled.

More than 3200 PhD students have graduated to date from an International Max Planck Research School.

Since their foundation in the year 2000, the Göttingen International Max Planck Research Schools in Molecular Biology and Neuroscience have met with extraordinary success. Every year, the programs receive hundreds of applications, with the quality of the students consistently being very high. Most students graduated so far have moved on to postdoctoral positions, many at prestigious international institutions. In the past years, the Göttingen Schools received unanimous acclaim during external evaluations and won national awards. For instance they are the only Life Science Programs within Germany that were selected for the “Top Ten International Master’s Degree Courses 2006”. The Schools have also re-shaped the local scientific community, strengthening the ties between the participating institutions, and initiated new scientific collaborations that augment the international reputation of Göttingen as a center of scientific excellence. Furthermore, the Schools served as role models and founding members of the Göttingen Graduate School for Neurosciences, Biophysics, and Molecular Biosciences, thus being instrumental for the continued support by the German Excellence Initiative provided to the university. We hope that in the years to come the students of the International Max Planck Research Schools will be successful in their professional careers. We also hope that they will remember their training period in Göttingen as an exciting and stimulating phase in their lives.

Peter Gruss
President
Max Planck Society

Marina Rodnina
Dean of the IMPRS
Molecular Biology
Overview

This yearbook is intended to provide information on the international MSc/PhD Molecular Biology Program in Göttingen, Germany, which was established in 2000 as a joint venture of the University of Göttingen and its non-university partners. It is also supported by the Max Planck Society as an International Max Planck Research School (IMPRS). In addition to general information on the program, the yearbook introduces the MSc students of the 2013/14 class, the faculty members, the program committee and the coordination team.

The program belongs to the Göttingen Graduate School for Neurosciences, Biophysics, and Molecular Biosciences (GGNB), which is funded by the Excellence Initiative of the German Federal and State Governments. It is offered by the Göttingen Center for Molecular Biosciences (GZMB), the Max Planck Institute for Biophysical Chemistry, the Max Planck Institute for Experimental Medicine, and the Leibniz Institute of Primate Research (German Primate Center). Further to their active participation in the Molecular Biology Program and the research activities of the GZMB, the above-mentioned partners closely cooperate in several research alliances, collaborative research centers, and interdisciplinary doctoral programs.

The intensive, research-oriented curriculum of the International MSc/PhD Molecular Biology Program qualifies students for professional work in the fields of molecular and cellular biosciences. The program is open to students from Germany and from abroad, who hold a Bachelor's degree (or equivalent) in the biosciences, chemistry, medicine, or related fields. Scholarships are available. All courses are held in English. The academic year starts in October and is preceded by a three-week orientation program. Applications may be submitted until January 15 of the year of enrollment. To ensure a high standard of individual training, the number of participants is limited to 20 students per year.

All students initially participate in one year of intensive course work. This first segment of the program comprises lectures, tutorials, seminars, methods courses, and individually supervised research projects (laboratory rotations). The traditional German structure of academic semesters is not followed. The condensed schedule allows students to accumulate 90 credits (ECTS) within one year, which would normally require three semesters.

Subsequently, two separate segments are offered:

- **PhD Program**: Good to excellent results after the first year qualify for direct admission to a three-year doctoral project in one of the participating research groups. The Master's thesis requirement is waived in this case. After successful defense of a doctoral thesis, the degree Doctor of Philosophy (Ph.D.) or the equivalent title Doctor rerum naturalium (Dr. rer. nat.) is conferred.

- **MSc Program**: Alternatively, students may conclude the program with a Master's thesis, based on six months of experimental scientific research. The degree Master of Science (MSc) is awarded upon successful completion of the Master's thesis.
### Funding of the Program

The Molecular Biology Program thanks the following institutions and funding initiatives, who contributed to the success of the Molecular Biology Program:

Donors
The Molecular Biology Program thanks the following companies for their donations, which were used to financially support students during the first year of studies:

Bayer AG, Leverkusen, Germany

Carl Zeiss Lichtmikroskopie, Göttingen, Germany

Degussa AG, Düsseldorf, Germany

DeveloGen AG, Göttingen, Germany

Heka Elektronik GmbH, Lambrecht / Pfalz, Germany

Hellma GmbH & Co. KG, Müllheim / Baden, Germany

KWS Saat AG, Einbeck, Germany

Leica Microsystems GmbH, Bensheim, Germany

Luigs & Neumann, Ratingen, Germany

Olympus Europa Holding GmbH, Hamburg, Germany

Roche Diagnostics GmbH, Penzberg, Germany

Sartorius stedim AG, Göttingen, Germany

Solvay Pharmaceuticals, Hannover, Germany

Springer Verlag, Heidelberg, Germany

Vossius & Partner, München, Germany
Intensive Course Program (First Year)

Throughout the first year, current topics in molecular biology are covered by
- lectures
- tutorials
- methods courses
- laboratory rotations
- seminars

Lectures and Tutorials

A comprehensive lecture series is offered in a sequence of 7-11 week units. The following topics are taught at an advanced level throughout the first year (36 weeks, 4 hours per week):

A. DNA and Gene Expression
   - architecture of the cell, energy metabolism
   - DNA and chromatin, epigenetics
   - DNA replication and repair
   - transcription, RNA splicing, RNA quality control
   - RNA-based regulation of prokaryotes and eukaryotes
   - translation, protein structures and folding, posttranslational modification

B. Metabolic and Genetic Networks
   - basic metabolism, metabolic networks
   - enzyme mechanisms and regulation
   - biological membranes
   - photosynthesis
   - signal transduction
   - genomics, bioinformatics

C. Functional Organization of the Cell / Immunology / Neuroscience
   - biosynthesis of organelles, nucleocytoplasmic transport
   - protein sorting and processing, membrane traffic
   - ubiquitin, autophagocytosis
   - cytoskeleton, cell adhesion
   - immunology, infectious diseases, principles of pathogenicity
   - cell cycle, apoptosis, cancer
   - neurons, synapses, synaptic transmission
   - glial cells and brain vasculature
   - nervous systems, sensory systems

D. Model Systems of Molecular Biology / Biotechnology
   - fungi
   - Arabidopsis
   - Drosophila, C. elegans
   - Xenopus, zebrafish, mouse
   - viral systems and their use in primate research
   - human genetics
   - biotechnology (bacteria, fungi, plants), tissue engineering

Each lecture is accompanied by a tutorial session, where students meet with a tutorial in small groups. Tutorials involve exercises, review of lecture material, and a discussion of related topics.
Methods Courses

During the two first months of the Molecular Biology Program, students participate in a series of methods courses to introduce them to principles and practical aspects of basic scientific techniques and the handling of model organisms. During the first two weeks, two 4-day projects with proteins and nucleic acids introduce various basic and advanced techniques. Week 3-7 comprise 10 two-day experiments on a variety of different methods indicated below. In addition, students are offered a choice of two (out of four) 5-day special courses with an integrated concept of lectures and hands-on experiments as indicated below.

Introductory 4-day methods courses
- Proteins
- DNA

Introductory 2-day methods courses
- gene expression analysis with microarrays or sequencing
- analysis of protein-protein and nucleic acid-protein interaction
- applied bioinformatics
- DNA sequence analysis and bioinformatics / modeling biological networks
- chemical and enzymatic analysis of RNA structure
- spectroscopic characterization of nucleic acids
- light microscopy
- analysis of cellular compartments
- cell culture
- expression analysis

Special 5-day methods courses
- X-ray crystallography
- (3-D-Cryo) Electron microscopy
- NMR spectroscopy
- mass spectrometry / proteomics

Laboratory Rotations

Starting in January, every student conducts three independent research projects (laboratory rotations) in the participating departments. Each project is individually supervised. These involve seven weeks of experimental work, followed by one week for data analysis and presentation. For each project, a report must be completed in the format of a scientific publication. The laboratory rotations must cover three different subjects.
Seminars
Seminars start in March. The class meets weekly for two hours to discuss two student presentations. The presentations are research reports based on work from the laboratory rotations.

Examinations
After the first year of intensive training, all students take one written and two oral Master's examinations. The Master's examinations explore the students' theoretical background in topics covered by lectures and tutorials. Each oral examination investigates the qualification in selected topics of the molecular life sciences.

PhD Program
Students who have passed the Master's examinations with good or excellent results qualify for direct admission to a three-year doctoral project in one of the participating research groups without being required to complete a Master's thesis first.

The PhD program emphasizes independent research on the part of the students. Doctoral students select three faculty members as their thesis advisory committee which closely monitors progress and advises students in their research project. Laboratory work is accompanied by seminars and lecture series, a wide variety of advanced methods courses, training in scientific writing and oral presentation skills, courses in intercultural communication, bioethics and research ethics, elective courses, and participation in international conferences or workshops.

Doctoral students of the program organize the international PhD student symposium “Horizons in Molecular Biology” every year with great success, attracting outstanding speakers and approximately 300 participants from all over the world. The meeting was designed by the students to promote scientific exchange between young researchers from different disciplines. Since 2007, a “Career Fair for Scientists” precedes the annual Horizons meetings. The career fair offers a unique and exciting program of career presentations, CV-Check, workshops and interviews and is also organized by the Molecular Biology students.

At the end of the PhD training program, a doctoral thesis is submitted either in the traditional format, or as a collection of scientific publications in internationally recognized journals along with a general introduction and a discussion of the results. The degree PhD or, alternatively, Dr. rer. nat. is awarded after the successful defense of the doctoral thesis.
**Master’s Program**

After the first year of intensive training, students may conclude the program with a six-month thesis project, leading to a Master of Science degree. The thesis project involves experimental work under the supervision of faculty member of the Molecular Biology Program. Students have the opportunity to conduct their Master's thesis project at a research institution abroad.

**Orientation, Language Courses, Social Activities**

A three-week orientation prior to the program provides assistance and advice for managing day-to-day life in Germany, including arrangements for bank account, health insurance, residence permit, housing, and enrolment. Students have the opportunity to meet faculty members and visit laboratories of the participating institutions. In addition, the orientation program informs students about computing and library facilities, the city and university of Göttingen, sports facilities, and cultural events.

Prior to the start of lectures and courses, basic knowledge in mathematics, chemistry and physics is refreshed in a one-week crash course, the so-called “Week Zero”.

An intensive basic language course in German is offered in cooperation with Lektorat Deutsch als Fremdsprache to facilitate the first weeks in Göttingen. Additional language courses and social activities accompany the program.

**Application, Selection, and Admission 2013**

Applicants must hold a Bachelor's degree or equivalent in biology, biochemistry, chemistry, medicine, or related fields. Applicants who are not native speakers of English should demonstrate adequate competence of the English language by acceptable results in an internationally recognized test.

In the year 2013, the Molecular Biology program received 523 applications from 63 countries.

EDUCATION
College / University
Sri Venkateswara College, University of Delhi

Highest Degree
Bachelor of Science (Honors) Biochemistry

Major Subjects
Biochemistry, Molecular Biology, Immunology, Genetics, Cell Biology, Membrane Biology, Bioenergetics, Recombinant DNA Technology

Lab Experience
Basic techniques in cell and molecular biology, immunology, enzymology including chromatography, ELISA, PCR, spectrophotometry, cell fractionation, gel electrophoresis, tissue studies, standard techniques used in recombinant DNA technology.

Projects / Research
2012 – 2013 “Screening of Indian population for possible polymorphisms in candidate genes of extracellular matrix proteins that could lead to disc degeneration leading to herniation”. Innovation Project, Dept. of Biochemistry, Sri Venkateswara College
6/2012 – 7/2012 “Study of the effects of administration of a synthetic peptide on the levels of inflammatory cytokines involved in rheumatoid arthritis”. Research intern at CSIR-Institute of Genomics and Integrative Biology, Delhi

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2012 – 2013 Student trainee stipend for the Innovation Research Project, University of Delhi

Marc Böhning

EDUCATION
College / University
Technical University of Munich (TUM)

Highest Degree
Bachelor of Science

Major Subjects
Genetics, Molecular Biotechnology, and Protein Biochemistry including Proteomics

Lab Experience
Various techniques in genetics, biochemistry and molecular biology as well as experience in cell culture and mass spectrometry

Projects / Research
5/2013 – 8/2013 “Affinity Determination of Kinases for Nucleotide Cofactors”. Bachelor’s Thesis, Chair of Proteomics and Bioanalytics (Prof. Küster), Technical University Munich, Freising, Germany
7/2012 – 5/2013 “Genetic Regulation of Benzoxazinoid Biosynthesis in Zea mays”. Chair of Genetics (Prof. Gierl), Technical University Munich, Freising, Germany

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
4/2013 – present Max Weber Program of the State of Bavaria (German National Merit Foundation)
4/2013 – present E-fellows.net scholarship
**H. Alice Buchner**

**EDUCATION**

**College / University**

**Highest Degree**

Bachelor of Science

**Major Subjects**

Molecular Medicine

**Lab Experience**

PCR mutagenesis, real-time PCR, cloning plasmids, transformation, cell culture with various transfection protocols, sequencing, gel electrophoresis, SDS-PAGE, western-blotting, luciferase assays, immunocytochemistry and chromatin immunoprecipitation.

**Projects / Research**

8/2009 – 9/2009 Methods internship at the Technische Universität München at the Department of Biochemistry

**Scholarships / Awards**

2013 – 2014 Stipend by the International Max Planck Research School

1/2011 – present German National Academic Foundation (Studienstiftung des Deutschen Volkes)

1/2011 – present E-fellows.net scholarship

---

**Priyanka Choudhury**

**EDUCATION**

**College / University**

University of Delhi, India

**Highest Degree**

M.Sc. in Biochemistry

**Major Subjects**

Molecular Biology, Recombinant DNA Technology, Immunology, Proteins and Enzymes, Developmental Biology, Cell Biology, Proteomics and Metabolomics

**Lab Experience**

Broad experience in various molecular biology, proteomics and immunology methods. I have also completed an add-on course in bioinformatics and computational biology, conducted by University of Delhi

**Projects / Research**

8/2012 – 4/2013 Research project: “Biochemical characterization of a putative UV-B receptor from *C. reinhardtii*”

5/2012 – 7/2012 Research project: “Insights into the potential role of chorismate mutase in the virulence of *Mycobacterium tuberculosis*

**Scholarships / Awards**

2013 – 2014 Stipend by the International Max Planck Research School

2013 Qualified the National Eligibility Test for CSIR-UGC – JRF

2013 Qualified GATE 2013 (Life Science)

2011 – 2013 Monsanto scholarship (top two rankers) by University of Delhi

2012 – 2013 Recipient of the Summer Research Fellowship, a national fellowship awarded by Indian Academy of Sciences
Ridhima Gomkale

EDUCATION
College / University
University of Delhi, India

Highest Degree
M.Sc. Biochemistry

Major Subjects
Molecular Biology, Immunology, Cell Biology, Proteins and Enzymes

Lab Experience
Techniques in molecular biology, cell biology and immunology, including cloning, western blotting, enzyme purification and characterization, spectroscopy (visible, fluorescence and CD), fluorescence microscopy etc.

Projects / Research
7/2012 – 4/2013 Research project: “Multiple putative hemoglobin reductases from Chlamydomonas reinhardtii support NO scavenging function of globins”
11/2009 – 1/2010 Physiology project: “Relation between Body Mass Index (BMI) and thyroid and lipid profile”

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2013 Qualified the National Eligibility Test of CSIR-UGC for Junior Research Fellowship
2011 – 2013 All India Post Graduate Scholarship
2008 Scholarship from CSIR

Sebastian Grosse

EDUCATION
College / University
Georg-August-Universität Göttingen, Germany

Highest Degree
Bachelor of Science

Major Subjects
Molecular Medicine

Lab Experience
Experience in standard and advanced biochemical techniques of working with DNA, RNA and proteins and working with yeast as well as human cell culture

Projects / Research
6/2013 – 8/2013 Department of Cellular Biochemistry, University of Göttingen Medical Center, Bachelor’s thesis: Protein interactions of human mitochondrial proteins with TIM21 / TIM50 and dynamics in regard to the association with the mitochondrial translocase and the MITRAC complex
7/2012 – 8/2012 Department of Cellular Biochemistry, University of Göttingen Medical Center, internship: Protein manipulation and purification of mitochondrial proteins in yeast
3/2012 – 4/2012 German Primate Center, internship: Gene regulation via small RNA molecules in human cells
2/2012 – 3/2012 Center of Anatomy, University of Göttingen Medical Center, internship: RNA probe generation and in situ hybridization

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
Martin Helm

EDUCATION
College / University
Friedrich-Alexander University Erlangen-Nürnberg

Highest Degree
Bachelor of Science

Major Subjects
Integrated Life Sciences – Biology, Biomathematics, Biophysics

Lab Experience
Proficient in all basic molecular techniques, ranging from biochemistry over developmental biology to immunology. Also well versed in bioinformatic applications and programs (Matlab & R) as well as biophysical methods like patch-clamp, optical tweezer or structural elucidation

Projects / Research
5/2013 – 8/2013 Establishment of the CRISPR/Cas9 system in Tribolium castaneum
10/2012 – 5/2013 Internship at Novartis Pharma GmbH, Clinical Research Rheumatology
5/2012 – 9/2012 Functionality of Zinc-finger nucleases in the red flour beetle Tribolium castaneum

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School

Damian Hernandez

EDUCATION
College / University
University of Miami

Highest Degree
Bachelor of Science

Major Subjects
Biochemistry and Molecular Biology

Lab Experience
Basic laboratory techniques in the field of molecular biology, such as fluorescent spectroscopy, PCR, Western Blots, gel electrophoresis, protein purification, etc.

Projects / Research
6/2012 – 5/2013 Recognition of YscF as an early substrate of type III secretion in Yersinia pestis. Lab of Gregory V. Plano. Department of Microbiology and Immunology, University of Miami

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
8/2009 – 5/2013 Dean’s Scholarship of the University of Miami
Prajwal Karki

EDUCATION

College / University
Bangalore University, India
University of Mysore, India

Highest Degree
Master of Science

Major Subjects
Biochemistry

Lab Experience
Proficient in standard methods and techniques in the field of biochemistry, molecular cell biology, microbiology and immunology

Projects / Research
1/2012 – 7/2012 Master's Dissertation “Purification of Braun's lipoprotein and characterization of its pro-inflammatory responses in murine models”. Dr. Gopal Marathe's Lab, Department of Biochemistry, University of Mysore, India
7/2010 “Proficiency Level Course” in Clinical Biochemistry, Genohelix Biolabs, Bangalore, India
2/2008 – 11/2009 Workshops and vocational training programs in “Medical Microbiology” and “Advanced Immunotechniques” from the Institute of Biosciences and Molecular Biology, Bangalore, India

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
7/2013 Gold Medal: First Rank in M.Sc. Biochemistry, University of Mysore

Ina Klusmann

EDUCATION

College / University
Royal Holloway, University of London, England

Highest Degree
Bachelor of Science (Hons)

Major Subjects
Biomedical Sciences

Lab Experience
Basic techniques in molecular biology, biochemistry and cell biology including protein purification and enzyme assays, ELISA, SDS-PAGE, Western Blot, PCR, RT-PCR, Y2H, molecular cloning techniques, mammalian and non-mammalian cell culture techniques

Projects / Research
6/2011 – 7/2011 “Y2H analysis of RTT107 domains”. Internship at the Max Planck Institute of Biochemistry, Martinsried, Germany
7/2009 Internship at the Stem Cell Engineering Laboratory, Max Planck Institute for Molecular Biomedicine, Münster, Germany

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2013 – present E-fellows.net scholarship
2010 – 2013 School of Biological Sciences Entrance Scholarship (Royal Holloway)
Melina Köppelmann

EDUCATION

Georg-August-Universität Göttingen, Germany

Highest Degree
Bachelor of Science

Major Subjects
Genetics, Biochemistry

Lab Experience
Various techniques in molecular biology such as PCR, agarose gel electrophoresis, transformation, Southern Blot, SDS-PAGE, affinity and size-exclusion chromatography

Projects / Research
11/2012 – 4/2013 In vitro complex formation of the proteasomal lid subunits Rpn5 and Rpn6 (Bachelor’s thesis at the Department of Molecular Microbiology and Genetics, Georg-August University of Göttingen)

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2011 – 2012 Deutschlandstipendium

Natalia Korniy

EDUCATION
College / University
Ivan Franko National University of L’viv, Ukraine

Highest Degree
Bachelor of Biology

Major Subjects
Biochemistry

Lab Experience
Various techniques in biochemistry and molecular biology

Projects / Research
2009 – 2013 Purification and characterization of abzymes from blood serum of systemic lupus erythematosus patients. Institute of Cell Biology, Ukraine
6/2012 – 8/2012 MicroRNA miR-980 in development of Drosophila sp. Max Planck Research Group of Gene Expression and Signalling, Max Planck Institute for Biophysical Chemistry, Göttingen, Germany

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2013 Student scholarship of the Victor Pinchuk Fund “Zavtra.UA”
2012, 2011 DAAD IAESTE scholarships for summer internships in Göttingen, Germany
8/2010 Partial scholarship from XLAB, Göttingen, Germany
David López de la Morena

EDUCATION
College / University
Universidad Complutense de Madrid, Spain

Highest Degree
Bachelor of Science

Major Subjects
Biotechnology, Cell Biology, Neurosciences

Lab Experience
Molecular biology and biochemistry techniques such as PCR, cloning, immunoprecipitation, immuno- and aptamer-staining and different protein purification methods. Confocal and STED imaging

Projects / Research
3/2013 – 6/2013 Application of aptamers and nanobodies at super-resolution microscopy. STED Microscopy Group, European Neuroscience Institute, Göttingen, Germany
10/2012 – 12/2012 Synaptic physiology of mammalian inner hair cells. STED Microscopy Group, European Neuroscience Institute, Göttingen, Germany
10/2010 – 6/2011 Study of a possible interaction between Tbr1 and KGA in the cytoplasm of mature neurons. Department of Neuroanatomy, University of Göttingen Medical Center, Göttingen, Germany

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
10/2012 – 12/2012 Goya-Mundus Scholarship
2006 – 2007 Excellence Credentials: study aid for outstanding academic achievement

Sebastian Ludwig

EDUCATION
College / University
Georg-August-Universität Göttingen, Germany

Highest Degree
Bachelor of Science

Major Subjects
Molecular Medicine

Lab Experience
FACS, PCR (qPCR, RT-PCR), gel electrophoresis (Agarose, SDS-PAGE), chromatographic methods, cell culture (eukaryotic and prokaryotic cells), molecular genetics (genotyping, vector design, transfection and transformation), microscopy (light- and fluorescence microscopy), in situ hybridization, Western Blot, animal experiments (behavioral, organ isolation), histology (paraffin sections, IHC), organelle extraction (mitochondria), protein-isolation (myelin, membrane proteins)

Projects / Research
05/2013 – 08/2013 Role of Sip1 in myelin homeostasis of the adult brain. Bachelor’s thesis at the Max Planck Institute for Experimental Medicine, Göttingen
01/2013 – 03/2013 Establishing of qPCR as a method to quantify APOBEC expression (DKFZ, Heidelberg)
07/2012 – 08/2012 Minocycline treatment study on CNP deficient mice. Max Planck Institute for Experimental Medicine, Göttingen

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
**Indira Memet**

**EDUCATION**

**College / University**
University of Bucharest, Faculty of Biology, Romania

**Highest Degree**
Bachelor of Science

**Major Subjects**
Biochemistry

**Lab Experience**
Basic techniques in biochemistry, molecular and cell biology, enzymology

**Projects / Research**
07/2012 – 06/2013 “Assessment of silicon quantum dots’ toxicity on MRC-5 cell line”

**Publications**

**Scholarships / Awards**
2013 – 2014 Stipend by the International Max Planck Research School
05/2013 1st prize (B.Sc. and M.Sc. section) at the Scientific Communication Session for Students, Faculty of Biology, University of Bucharest, Romania

---

**Elizabeth Miller**

**EDUCATION**

**College / University**
3/2012 – 7/2012 Ruprecht-Karls-Universität Heidelberg (semester exchange program)

**Highest Degree**
Bachelor of Science, Cum Laude

**Major Subjects**
Biochemistry and Molecular Biology, with honors

**Lab Experience**
Standard methods of biochemistry and molecular biology.

**Projects / Research**
8/2011 – 8/2013 Research in the oxidative stress response of Caenorhabditis elegans innate immunity, Gettysburg College, Gettysburg, USA
9/2012 – 12/2012 Research in the DNA damage response of Aspergillus nidulans, as part of the capstone degree requirements in Biochemistry and Molecular Biology, Gettysburg College, Gettysburg, USA

**Scholarships / Awards**
2013 – 2014 Stipend by the International Max Planck Research School
2009 – 2013 Gettysburg College Presidential Scholar – highest academic award, four-year annual $15,000 scholarship, dependent on continued academic merit at Gettysburg College
Sara Osman

EDUCATION
College / University
The German University in Cairo (GUC)

Highest Degree
Bachelor of Science

Major Subjects
Pharmaceutical Sciences and Biotechnology

Lab Experience
Cell culture techniques, SDS PAGE, agarose gel electrophoresis, PCR

Projects / Research
8/2011 – 9/2011 Application of the Selective 2’-Hydroxyl Acylation catalyzed by Primer Extension (SHAPE) technique for structural characterization of two RNA sequences; the lysine riboswitch and an artificial ribozyme, Jaeshcke Lab, IPMB, Heidelberg, Germany
7/2011 Pharmacological testing of Nutlin analogue for potential anti-tumour (cytotoxic) activity on different cancer cell lines, Pharmaceutical Biology department, GUC, Cairo, Egypt
1/2011 Genotoxicity testing of magnetite and cobalt nanoparticles to be used in photodynamic/photothermal therapy, Pharmaceutical Biology department, GUC, Cairo, Egypt

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2011, 2009 GUC Academic Excellence Award
2008 GUC Academic Scholarship
2007 Cambridge Award for Outstanding Academic Achievement

Marija Radovanovic

EDUCATION
College / University
University of Belgrade, School of Biology

Highest Degree
Bachelor of Science

Major Subjects
Molecular Biology and Physiology

Lab Experience
Transcranial magnetic stimulation. Basics of forensic science

Projects / Research
3/2013 – 8/2013 Practice in forensic science with Oliver Stojkovic, PhD, Institute of Forensic Medicine, School of Medicine, University of Belgrade
11/2012 – 1/2013 Practice in transcranial magnetic stimulation and pharmacology with Tihomir Vilić, PhD, Military Medical Academy-Clinic of Neurology, Belgrade, Serbia
8/2012 – 9/2012 Methods on the interface of neurochemistry and electrophysiology, IUPAB sponsored training school, Belgrade

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2013, 2012, 2011 Scholarship for the best students of University of Belgrade
10/2010 DAAD stipend: Summer School in Physiology and Molecular Biology in Belgrade, Serbia (organized by Serbian Neuroscience Society)
Frank Richter

EDUCATION

College / University
Jacobs University Bremen, Germany

Highest Degree
Bachelor of Science

Major Subjects
Biochemistry and Cell Biology

Lab Experience
Trained in cell culture, transfection, RNAi, immunofluorescence, RT-PCR, Luciferase Assay, protein purification and Western Blot

Projects / Research
03/2013 – 06/2013 “The role of heparanase in the regulation of EMT in melanoma”. Università degli Studi di Padova, Padua, Italy
09/2011 – 05/2012 Bachelor’s thesis: “Nuclear enzyme variants in cancer – can a changed distribution and activity promote tumor progression?”. Jacobs University Bremen, Germany

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2/2010 – present Studienstiftung des deutschen Volkes (German National Merit Foundation)
9/2009 – 6/2012 Merit Scholarship by Jacobs University Bremen covering tuition fee

Alan Rodríguez

EDUCATION

College / University
University of Swansea, United Kingdom

Highest Degree
Bachelor of Science

Major Subjects
Genetics and Biochemistry

Lab Experience
Chromatin immunoprecipitation, methyl DNA immunoprecipitation, PCR, agarose gel electrophoresis, cell culturing (Ishikawa and Heraklio cells), DNA phenol-chloroform extraction, RNA Trizol extraction

Projects / Research

Scholarships / Awards
2012 – 2013 Stipend of the Excellence Foundation for the Promotion of the Max Planck Society
2013 – 2014 Stipend by the International Max Planck Research School
2013 J. A. Beardmore prize in genetics “for production of an outstanding project dissertation in genetics or medical genetics”
Kashish Singh

EDUCATION
College / University
Sri Venkateswara College, University of Delhi, India

Highest Degree
Bachelor of Science (Honors) Biochemistry

Major Subjects
Biochemistry, Molecular Biology, Cell Biology, Membrane Biology, Immunology, Recombinant DNA Technology, Proteins and Enzymes, Bioenergetics

Lab Experience
Basic molecular biology and immunology techniques, including expression of recombinant protein, protein purification, enzyme assays and inhibition studies, sub-cellular fractionation, electrophoresis, spectrophotometry, PCR, SDS-PAGE, Western Blotting and ELISA

Projects / Research
7/2012 Screening of Indian population for possible polymorphisms in candidate genes of extracellular matrix proteins that could lead to Disc degeneration leading to herniation, Sri Venkateswara College, Delhi University, India
5/2012 – 7/2012 Studying the role of protein phosphorylation in signaling network of *Mycobacterium tuberculosis*, Institute of Genomics and Integrative Biology (IGIB), New Delhi, India

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2012 – 2013 Delhi University Innovation Project Fellowship

Minhui Su

EDUCATION
College / University
Hong Kong University of Science and Technology (HKUST), Hong Kong

Highest Degree
BSc in Biochemistry

Major Subjects
Molecular and cell biology, biochemistry

Lab Experience
Basic techniques in molecular biology, cell biology, biochemistry and molecular genetics; acute hippocampal slices preparation; immunohistochemistry

Projects / Research
6/2012-7/2013 Reversing Aβ-induced synaptic dysfunction by inhibiting the signalling of a receptor tyrosine kinase and characterization of small molecule inhibitors of the RTK. Prof. Nancy Ip’s lab, HKUST, Hong Kong
8/2012 Identification of new components/regulators of the DNA-damage response using molecular genetics of *Saccharomyces cerevisiae*. Prof. Steve Jackson’s lab, University of Cambridge, UK

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
2012 – 2013 HKSAR Government Scholarship
2010 – 2012 HKUST Scholarship Scheme for Continuing UG Students
2009 – 2010 Cheung On Tak Charity Foundation Scholarship
Vedran Vasic

EDUCATION

College / University
University of Wisconsin-Madison, USA

Highest Degree
Bachelor of Science

Major Subjects
Molecular Biology, Biochemistry

Lab Experience
Various techniques in molecular biology and biochemistry including DNA extraction, sequencing, primer design, mutagenic PCR, molecular cloning, cell culture, SDS-PAGE, protein purification, kinetics assays, FRET, flow cytometry, and HPLC

Projects / Research
9/2012 – 12/2012 The functional role of the Tyr-7 residue in Human Carbonic Anhydrase (HCAII). University of Wisconsin-Madison, Dept. of Biochemistry
1/2012 – 12/2012 Cell wall composition and digestibility of whole-stover and stalk-cores of diverse maize lines. University of Wisconsin-Madison, Dept. of Agronomy and Plant Sciences
5/2010 – 9/2010 The antitumorigenic properties of Adenovirus E1A-transformed cancer cells. Internship at the Medical College of Wisconsin, Dept. of Immunology

Scholarships / Awards
2013 – 2014 Stipend by the International Max Planck Research School
8/2012 – 9/2012 Syngenta Plant Science Scholar at the University of Wisconsin-Madison
10/2011 – 8/2012 Baden Württemberg Stipendium at Albert Ludwigs Universität Freiburg

Mathias Bähr

Professor of Neurology

- 1985 MD, University of Tübingen Medical School, Training in Neurology at University Hospitals in Tübingen and Düsseldorf
- DFG and Max Planck Fellow at the Max Planck Institute for Developmental Biology Tübingen and at the Department of Anatomy and Cell Biology, Washington University St.Louis
- Schilling-Foundation Professor for Clinical and Experimental Neurology, University of Tübingen
- Director at the Department of Neurology, University of Göttingen since 2001

Major Research Interests

Neuronal cell loss is not only a major feature of human neurodegenerative diseases like Parkinson’s disease (PD), Alzheimer’s disease (AD) or stroke, but can also be observed in neuroinflammatory conditions like Multiple Sclerosis (MS) or after traumatic lesions, e.g. of the optic nerve. We examine the cellular and molecular mechanisms of neuronal dysfunction and neuronal cell death in animal models of the respective disorders with the ultimate goal to detect new targets for a therapeutic neuroprotective intervention.

In PD for example, a multidisciplinary research team with our participation in the area C2 of the CNMPB examines the role of a-synuclein aggregation for dopaminergic dysfunction and cell death and characterizes other disease related proteins in order to develop new neuroprotective strategies. To that end we use AAV viral gene transfer to express different disease-associated and design mutants of a-synuclein in the nigrostriatal system of rodents and similar tools to develop new treatment strategies in PD and stroke, e.g. by viral vector or fusion-protein mediated delivery of protective molecules.

In the recent years it became also clear that axonal and neuronal loss do not only occur in classical neurodegenerative disorders but also in immune-mediated diseases like MS. To study this issue in more detail we have developed a model system of MS in rodents that reproducibly leads to optic neuritis, one of the most common early manifestations of MS. To monitor disease course we have established electrophysiological measurements like visually evoked potentials (VEP), electroretinogramm (ERG) and optical coherence tomography (OCT) that allow us to correlate onset, course and outcome of disease with and without therapy with histomorphological and molecular analyses. The aim is to describe in detail the molecular pathophysiology that leads to axonal and neuronal loss and to develop new therapeutic strategies, some of which have already been translated into proof of concept studies in human patients.

Selected Recent Publications

Holger Bastians

Professor of Cellular Oncology

- Professor of Cellular Oncology, University Medical Center, Göttingen (UMG), since 2013
- Heisenberg-Professor of Cellular Oncology, University Medical Center Göttingen (UMG), 2011 – 2013
- Heisenberg fellow, Philipps-University Marburg, 2008 – 2011
- Group leader, Institute for Molecular Biology and Tumor Research (IMT), Philipps-University Marburg, 2000 – 2010
- Postdoctoral fellow with Prof. Joan Ruderman, Harvard Medical School, Boston, USA, 1996 – 1999
- Dr. rer. nat., German Cancer Research Center (DKFZ), Heidelberg, 1996

Major Research Interests

Mitosis represents the key event during the eukaryotic cell cycle during which the DNA is equally distributed onto the two daughter cells. Defects in mitotic signaling pathways are often detected in human cancer and are directly associated with the missegregation of sister chromatids resulting in chromosomal instability (CIN) and aneuploidy. In fact, this is directly linked to tumorigenesis and represents a major characteristic of human cancer. However, the molecular mechanisms underlying CIN and the genetic lesions causing aneuploidy in human cancer are largely unknown.

In addition to its fundamental role for the maintenance of chromosomal stability, mitosis represents an important target for anti-cancer therapy and many anti-mitotic drugs including taxanes and Vinca alkaloids are frequently used in the clinic to treat various malignancies. However, it is still unclear how the interference with the mitotic progression is linked to tumor cell death, the desired outcome of therapy. A knowledge of this cross-talk is required for the development of future therapy concepts.

Based on these key points of cancer research our lab is focusing on the following main questions:

1. What are the molecular mechanisms of chromosome segregation during mitosis and what are genetic lesions in human cancer responsible for chromosomal instability?
2. What are the molecular mechanisms of mitosis associated cell death after chemotherapeutic treatment and what are the routes of chemotherapy resistance in human cancer?
3. Based on our investigations of mitotic signaling pathways we are aiming to identify novel mitotic drug targets in order to improve current therapies and to develop novel therapeutic concepts.

Selected Recent Publications

Tim Beißbarth

Associate Professor of Biostatistics

- Dr. rer. nat, University Heidelberg, 2001
- Postdoctoral fellow, Department Computational Molecular Biology, Max-Planck-Institute for molecular Genetics, Berlin, 2001 – 2002
- Postdoctoral fellow, Department Bioinformatics, WEHI, Melbourne, Australia, 2002 – 2005
- Group Leader, Bioinformatics & Modeling, Department Molecular Genome Analysis, DKFZ, Heidelberg, 2005 – 2008
- Professor, Statistical Bioinformatics, Department Medical Statistics, University Medical Center, Göttingen, Since 2008

Major Research Interests

The Statistical Bioinformatics group of the department of Medical Statistics is developing statistical applications and methods for biomedical research. We are closely working together with other biostatisticians/bioinformaticists as well as clinical and biological researchers. The focus of the group is the development of methods and tools to analyse biomedical data and to reconstruct biological networks. These methods are implemented mostly in the statistical computing environment of R.

Selected Recent Publications

Markus Bohnsack

Professor of Molecular Biology

- Dr. rer. nat. (PhD) at the Centre for Molecular Biology Heidelberg (ZMBH), University of Heidelberg (2005)
- Postdoctoral fellow at the University of Edinburgh, UK (2006 – 2008)
- Group leader at the Goethe University, Frankfurt (2008 – 2012)
- Adjunct Investigator at the Cluster of Excellence Frankfurt (2009 – 2012)
- Professor of Molecular Biology, University Medical Centre (UMG), Göttingen (since 2012)

Major Research Interests

RNA-protein complexes play central roles in many cellular processes, including the regulation of gene expression, translation and chromatin remodelling. Our group is interested in the biogenesis, functions and dynamics of RNA-protein complexes. In particular, we focus on understanding the regulatory role they often play during development, disease and differentiation. A major research theme of the laboratory is ribosome biogenesis, a fundamental process that is required for the production of all proteins and is closely coupled to the cellular growth rate. This highly complex processes involves the coordinated action of multiple cofactors proteins and large number of small nucleolar RNAs (snoRNAs), which basepair with and modify the ribosomal RNA. Much of our current knowledge of this complex process is derived from studies in the yeast *Saccharomyces cerevisiae*, where more than 200 cofactors have been identified. Despite the many links between ribosome production and disease, studies into ribosome production in human cells are still in their infancy.

Multiple genetic diseases are caused by mutations in ribosome biogenesis cofactors or ribosomal proteins leading to impaired ribosome production. These diseases, termed ribosomopathies, include Bowen-Conradi syndrome, Treacher Collins syndrome and various haematological disorders. For the Bowen-Conradi syndrome, we have shown that the methyltransferase EMG1 is mis-localised from the nucleolus when it carries the disease mutation, indicating that this mutation changes the interactions of EMG1 with other cofactors. Within the group, a number of projects focus on understanding the molecular mechanisms underlying several such diseases. Other projects in the laboratory concentrate on elucidating the functions of RNA helicases in modulating the structure and dynamics of RNA-protein complexes. In ribosome biogenesis, RNA helicases are proposed to mediate essential structural remodelling of pre-ribosomal complexes and we have shown that helicases also play a critical role in the release of specific snoRNAs from pre-ribosomes. We are successfully using the UV crosslinking and analysis of cDNA (CRAC) method to identify the interaction sites of RNA helicases and other RNA-binding proteins on cellular RNAs. This allows both biochemical characterization and functional analysis of these interactions, enabling us to also understand the regulation of the activity of the proteins. Interestingly, we have recently found that many RNA helicases function in several different cellular processes, indicating that they may be important for cross-regulation of these pathways in RNA metabolism.

* Equal contribution
Gerhard H. Braus

Professor of Microbiology and Genetics

• Diploma (Biology), Albert-Ludwig University, Freiburg i. Br. (Germany), 1983
• Dr.sc.nat., Swiss Federal Institute of Technology (ETH), Zürich (Switzerland), 1987
• Habilitation (Microbiology), Swiss Federal Institute of Technology (ETH), Zürich (Switzerland), 1991
• Associate Professor of Biochemistry, Friedrich Alexander University, Erlangen (Germany), 1993 – 1996
• Since 1996 Professor of Microbiology (since 2001 Professor of Microbiology and Genetics) in Göttingen

Major Research Interests

The major focus of the laboratory is on the control of developmental programs, protein turnover, pathogenicity and the interplay between development and primary and secondary metabolism. Our models are eukaryotic microorganisms (yeasts and filamentous fungi): (i) We are interested how light coordinates fungal development with fungal secondary metabolism and toxin production. (ii) Nedd8 is a ubiquitin-like protein which is involved in the control of protein turnover. We study the Nedd8-system including the COP99 signalosome using fungi as model systems. (iii) We are interested in the molecular control (protein turnover and translation) of adhesion as initial step in infection and biofilm formation. (iv) We study fungi as models for Parkinson (yeast), fungi as pathogens of immunocompromised patients (A. fumigatus) and as plant pathogens (V. longisporum).

Selected Recent Publications

Bertram Brenig

Full Professor of Molecular Biology of Livestock
• Director of the Institute of Veterinary Medicine
• Dr. med. vet., University of Munich, Munich 1987

Major Research Interests
The main interest of the laboratory is in the structural and functional analysis of mammalian genes and genomes. We are investigating the cause of different economical important genetic traits and defects in livestock and other domestic animals.

Currently we are working on the following projects
• Molecular genetics of Malvoy cataract
• Identification of the polled-locus in cattle
• Leg and feet quality in cattle
• Early embryonal death in cattle
• CNA in canine tumorigenesis

We are using whole genome association studies (WGAS) and next generation sequencing (NGS) techniques for the identification of chromosomal regions that are linked to the traits or disorders. Fine mapping, positional cloning and candidate gene analysis are used for further elucidation.

In recent years we have also focused on the analysis of circulating nucleic acids (CNA). The repertoire of CNAs in man, cattle, and dog has been determined and differences in CNA patterns are analysed regarding different diseases, e.g. canine mamma carcinoma, or performance traits, e.g. bovine early pregnancy determination.

- Director, Department of Molecular Neurobiology, Max Planck Institute of Experimental Medicine, Göttingen, Germany (since 2001)

Major Research Interests

Research in the Department of Molecular Neurobiology focuses on the molecular mechanisms of nerve cell development and synapse formation and function in the vertebrate central nervous system. We combine biochemical, morphological, mouse genetic, behavioral, and physiological methods to elucidate the molecular basis of nerve cell differentiation, synapse formation and transmitter release processes. Our work in the field of nerve cell development focuses on the role of protein ubiquitination and SUMOylation in cell polarity formation, cell migration, and neuritogenesis. The synaptogenesis research in our group concentrates on synaptic cell adhesion proteins, their role in synapse formation, and their dysfunction in neuropsychiatric diseases. Studies on the molecular mechanisms of neurotransmitter release focus on components of the presynaptic active zone and their regulatory function in synaptic vesicle fusion.

**Major Research Interests**

One research focus is on metagenomic analysis of complex microbial assemblages and culture-independent recovery of novel genes and gene products from environmental samples. This comprises the development of methods for direct isolation of high-quality nucleic acids from various microbial habitats and the construction of metagenomic libraries. High-throughput function-based as well as sequence-based approaches were performed. This work has led, i.e., to the successful identification and characterization proteases, chitinases, oxidoreductases, B12-dependent dehydratases, lipases, and DNA polymerases from metagenomes. To gain insights into the genomes of the uncultivated microorganisms and to deduce the metabolic potential and to determine key functions of the microbial community present in the studied environments direct sequencing, annotation of metagenomic DNA and mRNA (cDNA), and comparative genomics are carried out.

Other lines of research include whole-genome sequencing, transcriptomics and functional genomics of archaea, bacteria, and microbial communities. The majority of the analyzed organisms was of industrial importance or pathogenic. The latter group comprised, i.e., pathogenic *Escherichia coli*, *Listeria burkholderia*, and *Staphylococcus* strains as well as *Propionibacterium acnes*. The group also develops novel bioinformatic tools for data analysis and visualization.

- Head of the Department of Molecular Oncology, Georg-August-Universität Göttingen, since 2005

Major Research Interests

We are trying to understand the response of cancer cells to chemotherapy. In particular, we are analyzing the impaired replication of DNA and the damage response that results from injury to DNA. Our focus is on the signaling cascades driven by DNA damage, and on the activation of the tumor suppressor p53. Technologies include the use of large scale siRNA transfection, followed by automated fluorescence microscopy, and the analysis of DNA replication by incorporation of artificial nucleosides. As a disease model, we are investigating the response of colorectal cancer to therapy. On top of classical, DNA damaging chemotherapeutics, we are evaluating other broadly acting, yet non-genotoxic drug candidates, e.g. inhibitors of histone deacetylases and heat shock proteins. On long term, we are aiming at improving the response of tumor cells to chemotherapy by combining traditional and targeted therapeutic approaches.

Major Research Interests

Molecular Control of Zebrafish Oogenesis

Reproduction is a fundamental principle of all biological systems. To produce a new individual, multicellular organisms use specific cells called gametes. Female gametes form during oogenesis, which prepares the egg for fertilization and provides vital gene products for early embryogenesis. Defects in oogenesis lead to sterility and are frequently the genetic cause of human developmental disorders such as Down syndrome.

Our goal is to understand the molecular regulation of oogenesis. To investigate egg development in vertebrates, we take advantage of the molecular resources available in the zebrafish, Danio rerio. Using zebrafish genetics, genomics and bioinformatics, we focus on the identification of key genes crucial for two molecular processes during oogenesis:

I) The formation of germ plasm
II) Vitellogenesis – the endocytosis of yolk protein

Currently, we are applying cell biological and biochemical approaches in combination with embryological methods to molecularly characterize the identified genes. Through these methods we recently discovered the bucky ball gene, which represents the first gene in vertebrates inducing the assembly of germ plasm. Germ plasm describes a specific cytoplasm in the oocyte, which controls the differentiation of gametes in the developing embryo. The long-term aim is to provide important insights into the molecular mechanisms of oogenesis and how its failure leads to sterility and developmental defects.

Major Research Interests

The group is currently studying different aspects of the lipid metabolism of plants, algae, mosses and fungi. In this context we are primarily interested in the metabolism of structural lipids and lipid-derived signal transduction processes. For this purpose, we make use of both classical techniques as analytical chemistry and biochemistry as well as of modern approaches in the area of molecular genetics, including the generation of transgenic organisms („gain-of-function”) or mutants („loss-of-function”).

Biochemistry and function of oxylipin metabolism:

We are interested in physiological functions of lipid peroxidation processes. Thus we analyze the function of specific lipoxygenases, i.e. the role of their products, so-called oxylipins (oxygenated fatty acid derivatives), as signals or defence substances during biotic and abiotic stress. Lipid peroxidation reactions are analysed in general by metabolomic approaches and more specifically by studying the biosynthesis of aldehydes (fruit aromas) and hydroxy fatty acids (plant defence). Other studies deal with the role of oxylipins in plants, mosses and algae. In addition the catalytic mechanism of lipoxygenases and related dioxygenases is analysed.

Biochemistry of the biosynthesis of structural lipids:

Even in plants a huge number of different fatty acids are found. We are interested in enzymes which introduce new functionalities (i.e. double bonds at unusual positions or conjugated double bonds) in the fatty acid backbone in order to obtain new seed oils for biotechnological, nutritional and medical purposes. Moreover we study the biochemical pathways or networks that led to an increase in the seed oil content of oilseed crop plants and oleoogenous algae. Two other projects deal with the biochemistry and function of sphingolipids in plants and fungi as well as with wax ester forming enzymes. In addition we aim to identify chemical signals by metabolomics approaches that are exchanged during the infection between Verticillium longisporum and Arabidopsis thaliana.

Major Research Interests

Chromatin is the physiological template of genetic information controlling the capacity of a cell's genome to store, release, and inherit biological information. The fundamental unit of chromatin is the nucleosome: a stretch of DNA wrapped around a core of histone proteins (H2A, H2B, H3 and H4). Post-translational modifications of histones have emerged as key for regulating chromatin structure and are thought to crucially control chromatin dynamics and genome activity. Whereas more and more histone modification marks are being identified that alone or in combination could mediate distinct biological conditions of a cell and while correlative studies have begun to establish unambiguous links between several states of chromatin, various histone modifications, and diverse biological processes, our knowledge of how certain histone modifications exert their biological effects on a molecular/biochemical level is still very limited.

Due to their long-term stability, histone lysine methyl-marks are of particular interest to us, since they might be involved in establishing and maintaining durable and inheritable gene expression profiles (so called 'epi-genetic' regulation). Current projects include the study of Polycomb, HP1, and MBT proteins that bind to and act as effectors of distinct histone lysine methyl-marks. We are especially interested in the interplay of these factors and their cognate histone marks in regulating chromatin organization and dynamics. Furthermore, we are trying to identify and characterize novel binding proteins of various other histone modifications.

The long-term goal of our research is to gain mechanistic insight(s) into the signaling mechanisms and biological role of single but also combinations of histone modification marks and to understand how certain states of chromatin regulate the functionality of a cells genome. To this end, we aim to reconstitute chromatin-signaling pathways in recombinant and cell free systems and study their epi-genetic regulatory circuits in various biological model systems (i.e. *Xenopus laevis*, mice, tissue culture).

Major Research Interests

Our laboratory is interested in the molecular mechanisms establishing plant innate immunity. We focus on the elucidation of signal transduction mechanisms that lead to transcriptional reprogramming in the course of plant defense responses against bacteria and fungi. Plants have developed multiple layers of defense responses against pathogens. In general, infection of the model plant *Arabidopsis thaliana* with biotrophic pathogens (pathogens that exploit resources of living cells) leads to the activation of salicylic acid (SA)-mediated defense responses, whereas infection with necrotrophic pathogens (pathogens that kill cells to obtain access to nutrients) elicits jasmonic acid/ethylene (JA/ET)-dependent responses. If plants are infected by both types of pathogens, the SA pathway represses the JA/ET pathway (cross-talk). Members of the TGA family of transcription factors that have been identified as essential regulators of both responses. These proteins reside in the cell in an inactive state before pathogen infection. We are interested in the SA-mediated mechanisms that activate the function of TGA factors when they function as activators of the SA response (Fode et al., 2008). Moreover, we analyze, how mediate the negative effect of SA on the JA/ET response (Ndamuong et al., 2007; Zander et al., 2010; Zander et al., 2012).

We combine genetic (e.g. analysis of mutants and double mutants), molecular (e.g. gene expression analysis by real-time RT PCR), cell (subcellular localization and protein-protein interaction studies in living cells) and biochemical (e.g. chromatin immunoprecipitation) strategies to gain novel insights into these complex mechanisms.

A further project analyzes the function of the JA receptor COI1 in the defense against the vascular pathogen *Verticillium longisporum*. Whereas COI1 usually promotes defense responses against necrotrophic fungi when activated by JA, it promotes susceptibility independently from JA in response to infection with *V. longisporum* (Ralhan et al., 2012). Our aim is to understand the activation and the downstream effects of this novel COI1 function.

Major Research Interests

In the department, we develop NMR spectroscopic methods and apply them to the investigation of water soluble and membrane proteins, nucleic acids and their complexes as well as drug/target complexes. We are specifically focussing on the dynamics of biomolecules. Structural biology projects are performed in the context of signal transduction, ion channels, cytoskeletal proteins, enzymes and drug/target complexes using NMR as well as X-ray crystallography to characterize structure and dynamics. An applied project is the investigation of proteins involved in neurodegenerative diseases that are studied in the context of the CNMPB and involve NMR and other biophysical methods as well as chemical synthesis. Methods developments are aimed at pushing the limits of sensitivity for NMR spectroscopic detection (e.g. DNP), developing the measurement of structurally and dynamically relevant parameters, establishing methods to describe structural ensembles for folded and intrinsically disordered proteins. For solid state NMR investigations, pulse sequences that allow structure determination of uniformly labelled membrane proteins as well as oligomers and fibrils formed from proteins involved in neurodegenerative diseases have been successfully developed.

Major Research Interests
The protozoan parasite Toxoplasma gondii usually causes asymptomatic infections in immunocompetent adults leading to lifelong persistence especially in the brain and in muscle tissue. Life-threatening reactivation of such infection might occur in immuno-compromised individuals (i.e. patients suffering from AIDS). This parasite serves as a model organism for studying evasion mechanisms of intracellular pathogens.

We are interested in the cross-talk between the parasite and its host cell on a molecular level. We could demonstrate that the parasite (i) modulates the host cell capacity for MHC-restricted antigen presentation and (ii) inhibits apoptosis of the infected cell. Both mechanisms allow intracellular persistence. Vice versa, the host’s immune response determines the fate of the parasite by direct interference with differentiation processes of Toxoplasma gondii. The precise molecular events for these strategies of intense interplay between both partners are currently under our investigation.

Recently, we also started to investigate host-pathogen interactions of Campylobacter jejuni. This pathogen is the most prominent bacterial species that causes diarrhoea followed eventually by the development of neurological complications. Currently, we are focusing on the identification of putative virulence-associated factors. In addition, we are appointed the National Reference Center for Systemic Mycoses. In this respect, we are investigating fungal factors and mechanisms that are involved in pathogenesis of mycoses; i.e. cell wall structure and differentiation processes.

Major Research Interests

Biological structure formation and ageing.
Our group is interested in the molecular and cell-biological mechanisms how biological structures are formed. We analyse structure formation in the early Drosophila embryo employing genetical, biochemical and embryological experiments as well as live-imaging. Specifically we investigate how nuclear shape is determined and how the farnesylated protein Kugelkern is involved, how the cells are regularly arranged, how apical-basal polarity is established and how the number of synchronous cell divisions is robustly controlled. Based on our studies nuclear shape we have studied the function of the nuclear lamina and lamina proteins, such as lamin and Kugelkern, in ageing and stem cell proliferation and differentiation in the adult fly.

Major Research Interests

The question ‘How do proteins work?’ is our driving force. We study biomolecular dynamics and function by atomistic molecular dynamics and qm/mm simulations. Emphasis is on protein function, as well as on protein/DNA/RNA interactions.

Available projects address nuclear pore transport, the ribosome, molecular motors such as F-ATPase, protein unfolding as well as the interaction with radiation with a focus at single molecules, typically in close collaboration with experimental groups. The simulation of single molecule AFM experiments by force probe techniques helps us to reveal mechanisms of proteins function involving mechanical stress such as the muscular force sensor titin kinase, and so do improved methods to calculate thermodynamic quantities from simulations. We are continuously advancing our simulation techniques and scalability on massively parallel computers. The group of ca. 20 PhD students and post-docs shares a strong background mainly in physics, and scientific computing, but also in chemistry and biology. We enjoy exclusive access to a high-performance linux cluster of ca. 3000 processor cores.

Major Research Interests
Cancer is a disease that results from inappropriate cell division induced by hyperproliferation. In many cases, the development of cancer is associated with genes or signaling pathways important for patterning during embryogenesis. We investigate the role of the Hedgehog/Patched (Hh/Ptch) signaling cascade in the development of solid tumors. The focus is on tumors caused by mutations in Ptch, such as medulloblastoma, rhabdomyosarcoma and basal cell carcinoma.

The first aim is the discovery of molecular and cellular events that trigger the initiation of Ptch associated tumors. The second aim is to elucidate the function of Hh/Ptch signaling during tumor progression. The current focus is on the interaction between Hh/Ptch and Wnt signaling during formation, progression and regression of basal cell carcinoma. In addition, we are investigating the role of Hh/Ptch signalling in myeloid or T cells during tumorigenesis. The third goal is the identification of drugs that target solid tumors caused by mutations in Ptch. Currently we are analyzing the anti-tumor effects of the cytostatic drug doxorubicin and of Vitamin D3 derivatives. To test the anti-tumor activity of the drugs we use tumor-bearing Ptch mutant mice.

**Major Research Interests**

The work in our group is focused on the chemistry and biochemistry of natural and artificial nucleic acids, with special emphasis on functional and structural properties of catalytic DNA and modified RNA. Deoxyribozymes, also known as DNA enzymes or DNA catalysts, are single-stranded DNAs that are identified by in vitro selection from random-sequence DNA pools. Most prominent reactions catalyzed by DNA site-specific cleavage and ligation of RNA in different topologies. Catalytically active DNA molecules must fold into complex, three-dimensional structures that form the basis for their sophisticated functions. However, little is known about the molecular details of these structures and the mechanistic principles of DNA catalysis. We seek molecular level insights into the function and mechanism of DNA catalysts and approach these fundamental questions by a variety of chemical and biophysical methods. In this context, we developed reliable probing methods for the identification of critical molecular features for DNA catalysis. Other objectives are to demonstrate that DNA has the potential for novel chemical and biochemical catalysis and to apply deoxyribozymes for practical use. We explore the diversity of DNA-catalyzed reactions in as-yet unaddressed areas and develop nucleic acids as tools for post-synthetic modifications, such as site-specific attachment of fluorescent labels or other biophysical probes in DNA and RNA. We also study natural nucleic modifications, such as nucleobase and ribose methylations, and we use artificial nucleoside analogs, such as spin-labeled, fluorescent and caged nucleosides as probes for the investigation of RNA structure and function. We apply synthetic organic chemistry for generating modified nucleoside building blocks and use solid-phase synthesis, post-synthesis derivatization, enzymatic synthesis of RNA fragments and chemical and enzymatic ligation strategies for the preparation of complex RNA targets. The structural and biophysical properties of highly functionalized RNAs and their interactions with proteins are studied in collaboration with several other research groups at the Max Planck Institute for Biophysical Chemistry.

Major Research Interests

Our group is interested in the mechanisms of membrane fusion, with the main emphasis on regulated exocytosis in neurons. Intracellular membrane fusion events are mediated by a set of conserved membrane proteins, termed SNAREs. For fusion to occur, complementary sets of SNAREs need to be present on both of the fusing membranes, which then assemble in a zipper-like fashion to initiate membrane merger. The neuronal SNAREs are among the best characterized. They are the targets of the toxins responsible for botulism and tetanus, and they are regulated by several additional proteins including synaptotagmin, the calcium sensor for neurotransmitter release. To understand how these proteins mediate fusion, we study their properties in vitro with biochemical and biophysical approaches using native and artificial membranes.

In a second set of projects, we use modern techniques such as quantitative proteomics to better understand supramolecular protein complexes involved in synaptic function. Using our quantitative description of synaptic vesicles as point of departure we aim at unraveling presynaptic protein networks involved in synaptic vesicle docking and fusion. Furthermore, we are studying regulation of presynaptic function by small GTPases and by protein phosphorylation.

Major Research Interests

Our two major research interests are the investigation of the nanoscale architecture and dynamics of mitochondria and the analysis of reversibly switchable fluorescent proteins (RSFPs) as probes for super-resolution microscopy. Mitochondria are essential organelles in all eukaryotic cells and their dysfunction is involved in many devastating (neurodegenerative) diseases. We want to understand the organization of mitochondria on the nanoscale in healthy and challenged cells and investigate the molecular mechanisms that determine their intricate structure. We utilize a wide array of techniques, including molecular biology, biochemical methods as well as electron and super-resolution microscopy.

RSFPs are fluorescent proteins that may be switched by light between a non-fluorescent and a fluorescent state. Their unique properties open up numerous applications in microscopy and cell biology. We investigate the molecular switching mechanisms and aim to improve the properties of these fascinating proteins as probes for live-cell super-resolution microscopy.

Major Research Interests

The group is interested in the coordination between cell cycle and developmental control processes in mice. We apply biochemical, genetic and embryological techniques.

We previously identified the Geminin protein as a mediator between cell cycle progression and the control of axial specification. Geminin regulates homeodomain proteins of the Hox family both on a transcriptional and a chromatin level. Studying a conditional mouse knock-out model we found that Geminin is essential for the first cell divisions in murine embryos, but not later in development. Geminin is also necessary for the establishment, growth and maintenance of murine embryonic stem cells.

We further analyze the Mad2l2, a regulator of the APC/C complex, and a subunit of translesion DNA polymerase zeta. We study the role of Mad2l2 in cell cycle regulation with particular focus on the development of primordial germ cells. We generated a model where a programming of the germ cell fate is inhibited. On the other hand, we attempt to transdifferentiate somatic cells into a germ cells, following the approach used for induced pluripotency.

Major Research Interests

The long-range transport of membrane organelles in neurons depends primarily upon microtubules and motor proteins that move unidirectionally along these tracks. One type of microtubule-based motor proteins powering membrane transport is the kinesin superfamily. We are interested in how these motors achieve specificity in cargo binding, elicit membrane transport, and the regulation of transport activity. One example of a kinesin motor is UNC-104/KIF1A, which specifically transports presynaptic vesicle to the synaptic terminal and binds with its tail domain directly to membrane lipids in vitro. This unique cargo-interaction mechanism help us to understand how lipids and their membrane environment contribute to cargo transport, how motor-lipid interaction could be regulating transport, and how accessory proteins contribute to membrane motility. Using fluorescently tagged motor and vesicle markers we investigate these questions in the nervous system of the nematode C. elegans serves us as a model system for microscopic tools (confocal, TIRF, FRET FLIM) and biochemical transport assays in vitro.

Major Research Interests

In the Department of Molecular Genetics, headed by Prof. Dr. H. Kriebber, I try to identify new factors that might be involved in the export of mRNA from the nucleus in *Saccharomyces cerevisiae*. To this end, ordered mutants arrays are screened for genetic interactions with selected mutants by the so called SGA technique, which makes use of the genetic features offered by budding yeast to rapidly construct double mutants and compare their growth with that of single mutants. Furthermore, we want to extend these studies in different collaborations to microscopic screenings of those mutant arrays for export defects using automated microscopes. In a collaboration with Prof. Dr. S. Emmert from the medical faculty we want to analyse the function of the yeast *MPH1* gene and of its human homologue *FANCM*. The latter is a determining factor of the hereditary disease Fanconi anemia, which is – besides other symptoms - characterised by chromosome instability and increased incidence of cancer. Both are associated to homologous recombination and at least Mph1 is very likely involved in the error-free bypass of lesions, which are caused by DNA damaging agents and are blocking DNA replication, posing a very serious threat to the survival of the cell. Understanding these cellular responses to DNA damage will allow a better insight into central processes involved in the malignant transformation of cells.

Major Research Interests

The compartimentation of eukaryotic cells requires a machinery that is able to transport a great number of molecules into and out of the nucleus in a rapid, accurate and regulated manner. The natural cargos for this machinery are proteins and RNA-protein complexes (RNPs). For the mRNPs it has to be assured that intron containing pre messenger RNAs are retained in the nucleus until processing is completed. Only fully processed and spliced mRNAs are transported into the cytoplasm and translated at the ribosomes. The otherwise resulting gene products can be toxic to cells and harmful to organisms. Several examples exist where not fully processed pre-mRNAs reach the cytoplasm, resulting in diseases like cancer or neurodegenerative diseases. Our projects aim to identify and characterize the requirements for mRNA processing, transport and translation. We want to learn which proteins are associated with the transported RNP, how transport is regulated and how the cell distinguishes between export incompetent and export competent mRNPs. Moreover, we study the principles of mRNA quality control. Saccharomyces cerevisiae has been proven to be a useful model organism for eukaryotic cells and we use a combination of genetics, biochemistry and cell biology to uncover these processes.

- Professor at the University of Göttingen since 2009

Major Research Interests
Our laboratory is interested in the molecular analysis of plant innate immunity. Our research is focused on 1) the molecular dissection of mechanisms that control activation of basal defence in the plant model *Arabidopsis thaliana* 2) the analysis of defence mechanisms that contribute to resistance against fungal pathogens 3) the identification of fungal effector molecules that interfere with the plant defence machinery and allow host plant colonization
In nature, plants are constantly exposed to above- and below-ground attack by a vast array of potential pathogens. However, most plants are immune to the majority of would-be pathogens and susceptible to only a relatively small number of adapted microbes. Using a novel plant-fungus interaction model system we recently identified several molecular components that are required for the activation (Gimenez-Ibanez et al., 2009) and execution of basal plant defence (Collins et al., 2003; Lipka et al., 2005; Stein et al., 2006; Kwon et al., 2008; Lipka et al., 2008). As a consequence, receptor-mediated recognition, pathogen-induced intracellular transport processes, dynamic organelle translocation and cytoskeletal rearrangements represent major research topics in our department. Suppression of these defence mechanisms is a key requirement for adapted pathogens and we recently began studies to identify secreted fungal effector molecules that are likely to be involved. We combine genetic, cell, molecular and biochemical experimental strategies to gain novel insights into these complex mechanisms.

Major Research Interests

Most metazoan pre-mRNAs contain multiple introns and exons. In order to generate mature mRNA, the introns must be excised from the pre-mRNA, a process termed pre-mRNA splicing. In many cases, alternative splicing generates different mRNAs from a single pre-mRNA by the regulated removal of different sections of the RNA, a process which greatly expands the complexity of the repertoire of proteins that can be expressed from relatively small genomes. Splicing is catalysed by a large macromolecular machine, termed the spliceosome which consists of the small nuclear RNAs (U1, U2, U4, U5 and U6) and more than 150 proteins, 50 of which are associated with the snRNAs to form snRNPs.

In our laboratory, intense efforts are focussed on understanding how the spliceosome recognizes and binds the intron ends and discriminates them from exons. This is an especially confounding problem in metazoans because, in contrast to lower eucaryotes such as yeast, pre-mRNA introns are often extremely long (104-105 nucleotides), while exons are generally small (less than 300 nucleotides). Another major goal of our research is the elucidation of the mechanisms by which the spliceosome assembles into a catalytically active machine and catalyses intron excision. None of the building blocks of the spliceosome contains an active site. Instead, the catalytically active domain must be assembled anew on to each intron, a highly dynamic process which entails dramatic structural rearrangements of the RNP structure of the spliceosome, and which is orchestrated by the successive action of more than 10 enzymes such as RNA helicases and GTPases, as well as by posttranslational phosphorylation of a multitude of spliceosomal proteins. Our studies involve a large number of experimental approaches, including biochemical purification of entire spliceosomes or large protein ensembles, and characterization of their proteins by mass spectrometry; RNA biology methods such as enzymatic engineering of RNA molecules, RNA structure probing and RNA interference methods; production of recombinant proteins and antibodies; procedures for the investigation of protein-protein and protein-RNA interactions in vitro and in vivo; and biophysical methods such as fluorescence spectroscopy.

Finally, we are investigating the 3D structure of purified spliceosomes or major building blocks thereof using electron microscopic approaches and X ray crystallography. Our studies on the regulatory mechanisms of constitutive and alternative pre-mRNA splicing involve mainly mammalian systems. As the basic mechanisms of splicing catalysis appear to be evolutionarily highly conserved, we are also taking advantage of molecular genetic approaches in baker yeast to elucidate the structure and function of the catalytic core domain of the spliceosome.

Major Research Interests

Studying the molecular mechanisms controlling cell fate destiny and diversity is of fundamental interest for understanding pathological processes and diseases. We are using mouse genetics to study the role of transcription factors during cell differentiation in the endocrine pancreas and in the ventral midbrain.

In the pancreas, we are interested in molecules that control the endocrine cell subtype specification. In addition, we are studying animal models to uncover molecular pathways promoting beta-cell regeneration in the adult pancreas.

In the midbrain the specification of dopaminergic neurons is under the control of several transcription and secreted factors. Specifically, we want to identify factors that interact with Lmx1 a/b in order to promote the generation of functionally distinct dopaminergic neuron populations.

- 2001: Ph.D. with Peter Gruss at the Max-Planck Institute of Biophysical Chemistry, University of Göttingen

Major Research Interests

Adequate control of body motion and posture depends on elaborate circuitries that connect both motor and sensory neurons with the musculature. The central importance of these connections is illustrated by the debilitating consequences of diseases affecting motor neurons, such as Amyotrophic Lateral Sclerosis (ALS) and diabetic neuropathy. Our research aims at understanding the molecular mechanisms driving the assembly of functional neuromuscular circuitries during embryonic and postnatal development. This includes the study of cell surface-based signaling molecules that control motor and sensory axon connectivity in mice. Another research focus of the lab aims at identifying and characterizing novel mechanisms driving the functional specification of motor neurons within the context of operative neuromuscular circuitry. We extensively take advantage of mouse genetics in order to selectively trace and manipulate specific neuron populations. We combine this genetic approach with live 3D fluorescence (spinning disk) microscopy, as well as electrophysiological methods to elucidate the role of cell surface and nuclear receptor proteins in sensory-motor connectivity and functional neuron specification.

Major Research Interests

Our work focuses on the molecular physiology and pathophysiology of sound encoding at the hair cell ribbon synapse and its restoration. We have physiologically and morphologically characterized synapses of wild-type and mutant mice with defects in hair cell synaptic coding from the molecular to the systems level. This way we have contributed to the understanding of structure and function of the hair cell ribbon synapse and co-initiated the concept of auditory synaptopathy. Molecular dissection and detailed physiological characterization of ribbon synapse function employ a spectrum of molecular, biophysical, physiological, psychophysical and clinical approaches. Towards restoration of hearing we pursue the optogenetic stimulation of cochlea and gene replacement therapy.

Major Research Interests

We are interested in the mechanisms of neuron-glia interactions in the higher nervous system, and in the genes that are required for normal glial cell function. Here, transgenic and mutant mice have become important to study developmental processes as well as genetic diseases. For example, oligodendrocytes are glial cells highly specialized for enwrapping CNS axons with multiple layers of membranes, known to provide electrical insulation for rapid impulse propagation. We found that oligodendrocytes are also essential for maintaining the long-term integrity of myelinated axons, independent of the myelin function itself. The mechanisms by which oligodendrocytes support long-term axonal survival are still under investigation. The importance of glial cells as the “first line of neuroprotection”, however, is illustrated by several myelin-associated diseases in which axonal neurodegeneration contributes to progressive disability. These range in humans from peripheral neuropathies (CMT1) to spastic paraplegia (SPG2), and presumably multiple sclerosis (MS) and certain forms of psychiatric disorders. We are developing transgenic animal models for some of these diseases, in order to dissect the underlying disease mechanisms and, in the case of CMT1A, have used these models to design novel therapeutic strategies.

The glial “decision” to myelinate an axonal segment is partly controlled by the axon itself, but the signaling mechanism is not understood. We have found that axonal neuregulin-1 (NRG1) is the major determinant of myelination in the peripheral nervous system. We are now investigating NRG1 dysregulation also in CNS myelination, using quantifiable behavioural functions in mice. By combining genetics with environmental risk factors for schizophrenia (in collaboration with H. Ehrenreich) we will explore the hypothesis that NRG1, a known human schizophrenia susceptibility gene, points to an important role of myelinating glia in some psychiatric disorders.

Major Research Interests

Applied Synthetic Biology

Synthetic Biology is a new, actively growing field of the life sciences that combines elements from biology and engineering with the aim to design and create life forms with new, unprecedented properties and functions. Synthetic biologists have increased the coding potential of several organisms to allow genetic incorporation of additional “unnatural” amino acids into proteins. These unnatural amino acids have unique chemical or biophysical properties or carry naturally occurring (post-translational) modifications and are therefore fascinating new tools to investigate cellular processes.

Using these tools we develop new strategies to introduce spectroscopic probes into proteins to study the dynamic properties of chromatin. We are also interested in the effect of the post-translational acetylation of lysine residues on protein structure and function.

Major Research Interests

The differentiation of complex organisms has its origin in the asymmetric distribution of regulatory proteins or of the corresponding mRNAs in the egg, as well as in a complex system of cell/cell communication events via extracellular signalling molecules during early stages of embryogenesis. The genes that encode for these different activities form functional networks which provide the basis for the genetic programming of embryonic development. Our primary research interest is in the identification of such regulatory genes and networks in vertebrates, as well as in the definition of their regulation and function on the molecular level. For this purpose, we use *Xenopus laevis*, a frog from South Africa, as a model system. As a traditional object in experimental embryology and in comparison with other experimental systems such as the mouse, use of *Xenopus* offers a number of practical advantages. Oocytes and embryos are easy to collect in large numbers, they are easy to manipulate by relatively simple techniques, also because embryonic development proceeds in the petridish, and, more recently, it has even become possible to generate hundreds of transgenic frogs within a single experimental day. The research topics that we are focussing on are:

- Transport and function of vegetally localized maternal mRNAs
- Organogenesis: formation of pancreas and liver in vertebrate embryos
- Early neural development: primary neurogenesis
- Germ cell specification and migration

Major Research Interests

Fruiting-body development in filamentous ascomycetes

Fruiting-body development in filamentous ascomycetes is a complex cellular differentiation process that requires special environmental conditions and is controlled by many developmentally regulated genes. We are interested in the genes regulating this development process. We use the homothallic (self-fertile) ascomycete *Sordaria macrospora* as a model organism. Numerous mutants which are blocked at various stages of fruiting-body development have been generated and molecular genetic procedures have been applied to isolate genes involved in fruiting-body development. In addition to mutants generated by chemical mutagenesis, several mutants affecting fruiting-body development were produced by knock-out of mating-type genes, pheromone and receptor genes, as well as genes involved in autophagy and bicarbonate metabolism.

Fungal inteins

An intein is a self-catalytic protein-intervening sequence that catalyses its precise excision from a host protein and the ligation of its flanking sequences, termed N- and C-exteins, to produce the mature spliced product. Protein splicing is a post-translational event that releases an internal intein sequence from a protein precursor. Projects in the lab aim to analyse the splicing activity of inteins detected in the *prp8* gene of fungi. Because of their compactness and high splicing activity inside foreign proteins, fungal *PRP8* inteins may be used for the development of new intein-mediated protein-engineering applications such as protein purification, addition of fluorescent biosensors and expression of cytotoxic proteins.

Professor, Head of the Infection Biology Unit, German Primate Center

- 2000: Ph.D., Friedrich-Alexander-University Erlangen-Nürnberg
- 2000 – 2003: Postdoctoral Fellow, University of Pennsylvania
- 2007 – 2010: Professor for Experimental Virology, Hannover Medical School
- 2010: Professor and Head of the Infection Biology Unit of the German Primate Center

Major Research Interests

The Infection Biology Unit investigates virus host cell interactions with a focus on the first step of the infection process, viral entry into target cells. Emerging viruses, like the Middle East Respiratory Syndrome (MERS) coronavirus, can pose a serious threat to public health. Activation by host cell proteases is essential for infectivity of many emerging viruses. We are elucidating which proteolytic systems are hijacked by emerging corona-, filo-, bunya- and influenza viruses for activation. On the basis of this information we will identify inhibitors and evaluate their antiviral activity in cell culture and animal models. Moreover, we are interested in defining which host cell receptors are used by emerging viruses for cellular entry. Finally, we are investigating how interferon-induced antiviral effector molecules inhibit infection by emerging viruses.

Human immunodeficiency virus (HIV) is the causative agent of the acquired immunodeficiency syndrome (AIDS), a major global health crisis. We seek to understand how the composition of the glycan coat of the HIV envelope protein modulates viral spread in and between individuals. This question will be addressed by employing simian immunodeficiency virus (SIV) infection of macaques as model system for HIV infection of human molecules of the innate immune system.

• Since 2010 Group associated with the Max Planck Institute for Biophysical Chemistry

Major Research Interests
We are interested in understanding the molecular mechanisms by which proteins are transported across the mitochondrial membranes and to find out how multi-protein complexes in the inner membrane (TIM complexes; translocation machineries of the inner membrane) mediate this task. In another aspect of our work we addresses the question how newly imported proteins assemble into multi-protein complexes in the inner membrane. In case of the respiratory chain complexes the assembly process is especially demanding since central subunits of the complexes are made within mitochondria. Dedicated chaperone-like factors are required to assist and regulate assembly and translation in mitochondria. The analysis of the principles of the biogenesis process and the activities of the assembly factors is of central importance for our understanding of the molecular basis of human mitochondrial disorders.

Group Leader STED Microscopy of Synaptic Function

- 2000 – 2004 Research assistant with William Betz at the Dep. of Physiology and Biophysics, University of Colorado Health Sciences Center (USA)
- 08/2004 PhD degree (Physiology) awarded by the University of Colorado
- 2004 – 2007 Post doctoral fellow with Reinhard Jahn at the Neurobiology Department of the Max Planck Institute for Biophysical Chemistry in Göttingen (Germany)
- since 2007 Group Leader (STED Microscopy) at the European Neuroscience Institute Göttingen (ENI-G)

Major Research Interests

Conventional fluorescence microscopy is limited by the diffraction of light: fluorescent objects that are close together cannot be discerned. Stimulated emission depletion (STED) is a recent advancement in optical physics that breaks the diffraction barrier, allowing microscopes to obtain much clearer images. The diffraction barrier has been particularly problematic for imaging synaptic vesicles, which are among the smallest known organelles (30-50 nm in diameter). They are located in small areas in the synapses (about 1 micron in diameter). The group takes advantage of the increased imaging resolution provided by STED to investigate synaptic vesicle function, with an emphasis on synaptic vesicle recycling. Since STED microscopy also allows imaging of protein domains, the group aims at studying the patterning of protein domains in the synapse, in order to understand its molecular architecture.

Major Research Interests

1. Ribosome function and dynamics
2. Regulation and fidelity of translation
3. Ribosome-catalyzed reactions

Protein synthesis from amino acids in the cell is performed on ribosomes, large ribonucleoprotein particles that consist of several RNA molecules and over 50 proteins. The ribosome is a molecular machine that selects its substrates, aminoacyl-tRNAs, very rapidly and accurately and catalyses the synthesis of peptides from amino acids. Among the most important unresolved questions is the role of structural dynamics in ribosome function. The communication between the functional centers of the ribosome is known to be crucial, but there are only vague ideas as to how this may take place. The activation of the GTPase of elongation factor (EF)-Tu is a key step in selection of aminoacyl tRNAs by the ribosome. It is triggered by events on the small subunit, but the GTP-binding site of EF-Tu associates with the large subunit, and the way the signal is transmitted within the ribosome remains unknown. The mechanism of the translocation step, i.e. the movement of tRNAs and mRNA through the ribosome, remains a major challenge. EF-G accelerates translocation by using the energy of GTP hydrolysis to drive translocation which resembles the way motor proteins work; however, the structural basis for the movement and its biophysical characteristics are not known. Finally, incorporation of unusual amino acids, such as selenocysteine, requires highly specialized machinery for delivery; very little is known about the molecular mechanism of this process. None of these problems can be solved without using a combination of techniques from Biochemistry, Structural Biology and Physical Biochemistry and developing new approaches to structure, function, and dynamics of the translational apparatus. In a broader context, the ribosome can serve as a well-characterized model of large macromolecular assemblies. Using the biophysical approaches devised for the ribosome, it should be possible to obtain information for even larger and more complex macromolecular assemblies. Developing of highly efficient and controlled ribosome translation systems on a highly sophisticated technological level is important for production of proteins with desired properties for purposes of proteomics and high-throughput structural studies emerging in the post-genomic era. The translational apparatus is a major target for antibiotics. Better understanding of the mechanisms of antibiotic action, resistance mechanisms and the interplay between resistance and bacterial fitness using systems biology will be increasingly important for developing new antimicrobials and combating the major infectious diseases.

- 2013 Professor Molecular and Behavioral Neurobiology, Dep. of Psychiatry, LMU Munich

Major Research Interests

Our research interest is directed towards the generation and analysis of transgenic mouse mutants in order to understand individual gene functions in the adult brain. Towards this goal, we employ mouse genetics, molecular/biochemical and behavioral techniques. Our current interest focuses on basic-helix-loop-helix (bHLH) transcription factors. Several loss- and gain-of-function mouse mutants of the bHLH family that we and others have analyzed display behavioral alterations frequently also observed in psychiatric diseases. Among these are alterations of the sleep-wake or circadian behavior, altered cognitive performances and disturbed environmental adaptations to time shifts (jet-lag) or social stress. At the molecular level, we find several signaling pathways to be deregulated that likely provide a mechanistic link between disturbed environmental adaptations and deregulated gene expression seen in bHLH mouse mutants. To study cellular signaling upstream of gene expression, we have developed a series of genetically encoded biosensors that can be analyzed with standard fluorescent or luminescent reporter proteins but also with libraries of molecular barcodes to perform systems-level analyses. Currently, we aim at combining mouse models and genetic sensors to better understand the molecular adaptations of gene-environment interactions relevant for psychiatric and neurological diseases.

Major Research Interests

Activity-dependent modulations of synaptic transmission are important mechanisms of information processing and storage in neuronal circuits. A variety of related but mechanistically distinct forms of synaptic plasticity have been described in vitro preparations of brain slices. A major goal of my laboratory is to elucidate the underlying molecular events, leading to and regulating changes in synaptic efficacy. Newly developed techniques of molecular replacement, using mouse genetics and/or viral-mediated gene transfer allow us to manipulate the molecular composition of single neurons in a spatial and temporal controlled manner. In particular, we are able to investigate the effects of heterologously expressed proteins on the background of wild-type neurons, or neurons, in which the endogenous protein expression is diminished. We combine this technique with simultaneous dual whole cell patch clamp recordings from rodent brain slices to monitor changes in synaptic efficacy in the manipulated cell in comparison to the neighboring control cell. Knowledge gained from the understanding of molecular mechanisms of synaptic transmission and plasticity will ultimately provide important clues for the function of neuronal circuits and potentially the functioning of the brain.

Major Research Interests

Branched tubular networks are a fundamental structural design of many organs including lung, vascular system and kidney. Critical for organ function, i.e. the transport of fluids or gases, is the proper size and diameter of the tubular branches as well as an elaborated network formation. How do these networks develop? How do the branches grow out, detect their fusion partners and interconnect? How are tube size and diameter controlled? How can the system respond to different physiological needs? How do epidermal sheets control the paracellular passage of solutes?

We investigate the development of the Drosophila tracheal (respiratory) system since it provides an ideal model to address such questions, because of its simple stereotypic architecture, accessible genetics and molecular tools.

- 2000 – 2007 Research group leader at the Centre for Molecular Biology (ZMBH), University of Heidelberg
- 2004 Habilitation (Molecular Biology and Cell Biology) at the ZMBH
- 2007 – 2010 Wellcome Trust Senior Research Fellow, Faculty of Life Sciences, University of Manchester, UK
- since 2010 Professor of Biochemistry and Director of Biochemistry I
- since 2010 the group is associated with the Max Planck Institute of Biophysical Chemistry

Major Research Interests

The group works on different aspects of membrane protein biogenesis and its integration into the physiology of organs such as the brain or the heart. We study the early life of tail-anchored proteins that are post-translationally targeted to the endoplasmic reticulum for membrane integration. Other projects address the role of sorting motifs during the passage of ion channels and neurotransmitter receptors through the secretory pathway. One channel under investigation (the KATP channel) couples cellular metabolism to insulin secretion in pancreatic beta cells. In the brain and the heart KATP channels play less defined roles that we currently address employing biochemical methods. We study biogenesis and trafficking under (patho)physiological conditions in genetically tractable model organisms such as yeast or mouse. Besides membrane protein biochemistry we use GFP-based physiological sensors for small molecules and ions in cellular compartments. This allows us to tackle how ion channels and transporters contribute to different physicochemical milieus inside cells.

- 2012 Habilitation in Developmental Biology, Georg-August University, Göttingen, Germany

Major Research Interests

My lab is focused on understanding of biological roles of miRNAs in cell differentiation and maintenance under normal, stress, and disease conditions in *Drosophila*. We show that the miRNAs-based regulatory network is accomplished via feedback-feedforward signaling, which allows to reduce transcriptional noise and fine-tune gene expression to regulate the entire gene expression profile. In addition, tissue-specific miRNAs direct differentiation toward corresponding lineages by suppressing alternative cell fates and ensuring the robustness of cell identity. Under stress and in chronic pathological states, miRNA levels are misregulated which disrupts tissue regeneration and homeostasis due to miRNA influence on cell proliferation and differentiation programs. We found that miRNAs act as spatio-temporal cell fate determinants, differentiation guardians and canalization factors, and stress response elements. We use *Drosophila* as a model organism that can serve as a valuable model system for conserved mechanisms underlying human disorders. One of our scientific interests is the analysis of the Dystrophin Glycoprotein Complex (DGC), perturbation in which results in muscular dystrophies and brain abnormalities in humans. We found that stress induces muscle degeneration even in wild type animals and accelerates age-dependent muscular dystrophy. In view of the facts that miRNAs have been implicated in stress response and the DGC has an effect on miRNA expression in vertebrates, we have conducted a miRNA microarray screen in stressed and not stressed wild type and dystrophic animals. The second line of the research that is actively conducted in my lab is focused on studying the role of the microRNA pathway in stem cells, where the *Drosophila* germline and neuronal stem cells are used as model systems. Our findings show that hormonal signaling and miRNAs direct neuronal and germline stem cell differentiation. Not only do steroid hormones control the miRNA expression, miRNAs also act in feedback loops to regulate the strength of the hormonal signaling. This provides the means to fine-tune the signals managing stem cell division, maintenance, and differentiation in response to ever-changing extracellular conditions.

Mechanisms of myelin biogenesis and repair

The myelin sheath is one of the most abundant membrane structures in the vertebrate nervous system. It is formed by the spiral wrapping of glial plasma membrane extensions around the axons, followed by the extrusion of cytoplasm and the compaction of the stacked membrane bilayers. These tightly packed membrane stacks provide electrical insulation around the axons and maximize their conduction velocity. Axonal insulation by myelin not only facilitates rapid nerve conduction but also regulates axonal transport and protects against axonal degeneration. Damage to the myelin sheath, as it for example occurs in multiple sclerosis (MS) results therefore in severe neurological disability also as a result of neurodegeneration.

Our main goal is to come up with new approaches of how to promote remyelination in demyelinating diseases such as MS. To realize this goal we need to understand how myelin is formed during normal development.

- 2005 – 2007 BioFuture group leader
- since 2007 Professor for Molecular Electron Cryomicroscopy, University Göttingen and group leader, Max-Planck-Institute for Biophysical Chemistry

Major Research Interests

The work in our group is focused on 3D structure determination of large macromolecular complexes by single particle electron cryomicroscopy (cryo-EM). In cryo-EM, thousands of electron microscopical images of a macromolecular complex are taken at low temperature in the electron microscope and are used to calculate a 3D reconstruction of the object by computational image processing. Electron microscopical images can be considered as almost ideal two-dimensional projection images, similar to images obtained by computer tomography in medical applications. However, in cryo-EM the relative orientation of the molecules is a priori unknown and must be determined by computational means prior to calculating the 3D structure.

Cryo-EM is the method of choice for 3D structure determination of macromolecular complexes that are difficult to purify in the amounts and quality that is required for crystallization (X-ray crystallography). Due to the low copy number of many functionally important macromolecular complexes in the cell, cryo-EM is very often the only available method to study the 3D structure of these large macromolecules. Work in our group concentrates on macromolecular complexes related to pre-mRNA splicing, translation and cell cycle regulation and on the development of new methods to improve sample preparation, imaging and computational image processing techniques.

Major Research Interests

Our group studies the regulation of metabolism in the pathogenic bacterium *Mycoplasma pneumoniae* and the model organism *Bacillus subtilis*. We are following global (“post-genomic”) and gene-specific approaches. In *Mycoplasma pneumoniae*, we study the regulation of gene expression in this pathogenic bacterium and its relation to pathogenicity. This is highly interesting because this bacterium is an important cause of pneumonia. Moreover, *M. pneumoniae* is one of the organisms with the smallest genetic equipment that is capable of independent life. Understanding *M. pneumoniae* means understanding life! Specifically, we are analysing protein phosphorylation and mechanisms of transcription regulation in *M. pneumoniae*. We have shown, that protein phosphorylation of is of key importance for pathogenicity of *M. pneumoniae*. Metabolism in *Bacillus subtilis* is studied by transcriptomics, metabolome and fluxome analyses. Our specific interests are focussed on two key pathways: glycolysis and glutamate biosynthesis, the decisive link between carbon and nitrogen metabolism. The regulation of glycolysis is studied at the level of a controlled protein-RNA interaction. Regulation through RNA has become widely recognized in the past few years. Our studies revealed that glycolytic enzymes themselves are part of a protein complex that is required for mRNA processing and degradation. Finally, we are interested in systems biology approaches to the analysis of *B. subtilis* and develop web interfaces for the functional annotation.

Major Research Interests

We are studying the molecular mechanism of autophagy in the yeast *Saccharomyces cerevisiae*. Autophagy is a starvation induced transport pathway, which delivers cytosolic material for degradation to the lysosome (vacuole). It is highly conserved in all eukaryotes from yeast to human and helps the cells to survive periods of nutrient limitation.

Autophagy further plays an important role in ageing, the development of breast cancer and cardiomyopathy and it was linked to neurodegenerative diseases like Alzheimer’s, Huntington’s and Parkinson’s disease. Autophagy is mechanistically unique, since its transport intermediates, the autophagosomes, are surrounded by two individual membranes. It starts at the newly-discovered preautophagosomal structure, where autophagosomes are formed. Autophagosomes unspecifically enclose parts of the cytoplasm including organelles like mitochondria, peroxisomes and parts of the ER.

When the autophagosomes reach the vacuole, their outer membrane-layer fuses with the vacuolar membrane and a still membrane-enclosed autophagic body is released into the vacular lumen. In the vacuole autophagic bodies are lysed and broken down together with their cytosolic content. The intravacuolar breakdown of autophagic bodies requires the selective lysis of their limiting membrane. Due to the use of two limiting membranes the biogenesis of autophagosomes is a very unique process. Molecular dissection of this process is one of our main areas of research.

Major Research Interests

The central research topic of our department is the analysis of molecular reaction mechanisms of enzymes as nature's chemical catalysts. In this context, we study enzymes with vitamin-derived cofactors, with metal ions, and Schiff base-forming enzymes. A particular focus is laid on the structural and kinetic characterization of enzymatic reaction intermediates by high-resolution X-ray crystallography, steady-state and transient kinetic methods, NMR spectroscopy and theoretical studies. Knowledge about the reaction mechanism is exploited to redesign enzymes for biocatalytic applications and for drug design.

Major Research Interests

Modern mass-spectrometric methods have become key technologies in the life sciences. We apply “state-of-the-art” mass spectrometry to elucidate quantitative changes of proteins and their post-translational modifications derived from different samples, including tissue, cells, organelles, and cell compartments. In addition we apply mass spectrometric methods to monitor dynamic changes of protein and protein-ligand complexes through use of crosslinking and chemical probing. In this respect, we collaborate with several groups within the GGNB, like the groups of Wolfgang Fischle, Dirk Görlich, Reinhard Jahn, Reinhard Lührmann, Peter Rehling, Oliver Schlüter, Holger Stark, Jürgen Wienands, Markus Zweckstetter, and many others. We provide solutions and analytical workflows for solving cell biological issues; we further develop novel analytical workflows for in-depth analyses of entire proteomes and for structural analyses of proteins.

Major Research Interests

Natural killer (NK) cells belong to the lymphocyte lineage and represent an essential part of the innate immune system. Upon interaction with target cells and stimulation via various receptors, NK cells can kill other cells and secrete substantial amounts of cytokines. Signals from activating and inhibitory NK cell receptors are integrated and regulate the activity of NK cells. Typical targets for NK cell killing are virus-infected or malignant cells, which both frequently reveal changed patterns of ligand expression on their cell surface. Such changes are recognised by NK cells, leading to killing of virally infected or transformed cells. NK cells can also be activated by different stimuli during interaction with dendritic cells, leading to release of pro-inflammatory cytokines and anti-viral substances. Due to these properties, NK cells play also important roles in autoimmune diseases, transplantation, and reproduction. Recently, NK cells were shown to possess immunological Our interests lie in biology and genetics of natural killer (NK) cells. In particular, we are interested in NK cell receptors and their interaction with MHC class I ligands and the regulation of NK cell activation. Furthermore, we analyse the role of micro-RNA molecules in the regulation of NK cell activity (see also below).

A further research area includes small non-coding RNA genes and molecules (micro-RNA, siRNA, snoRNA) and their role and contribution in various virus infection models including human immunodeficiency virus (HIV).

Major Research Interests

The signature structure of B lymphocytes is their clonotypic antigen receptor (BCR). Our major research focuses on the elucidation of intracellular BCR signaling pathways that regulate the development and activation of B cells in health and disease. We have identified enzymatically inert adaptor proteins such as SLP-65 (for: SH2 domain-containing leukocyte adaptor of 65 kDa), which nucleate the formation of multi-molecular protein complexes to integrate and amplify BCR signals. A key function of these signaling modules is to orchestrate the mobilization of the second messenger Ca²⁺. Interference with expression and/or function of one the signaling components can cause severe immunodeficiencies in mouse and man. Moreover, viruses such as the Epstein-Barr virus (EBV) abuse BCR effector proteins to reorganize signaling cascades for their own benefit. Biochemical and genetic methods, which are applied to study these events in vitro and in vivo, include protein purification by affinity chromatography and immunoprecipitation, analysis of protein interactions, flow cytometry, targeted gene disruption in cell culture and embryonic stem cells followed by reconstitution experiments using electroporation techniques or retroviral gene transfer.

Major Research Interests

Phylogenetic Variance and Plasticity of Developmental Processes. A key question in evolutionary developmental biology is how diverse animal body plans are specified. To identify the plasticity in developmental processes, we study their conservation and divergence in different arthropod species by transgenesis and functional genomics approaches. This will help us to understand how animal evolution is based on changes in gene regulation governing pattern formation processes.

Smelling Beetles: Stink Glands and Odour Detection the Red Flour Beetle Tribolium castaneum. Beetles are prolific producers of repellent and/or toxic compounds. Defensive substances are usually multifunctional: as repellents, toxicants, insecticides, or antimicrobics, they are directed against a large array of potential target organisms or may function for boiling bombardment or as surfactants. We are interested both in the development of these glands as well as their biochemical composition and biological function. The red flour beetle also offers a great system to address olfaction from the odour recognition and discrimination at the periphery to the analysis of the plasticity of the central olfactory pathway. Our focus lays on the biological function of odorant binding proteins (OBPs) and sensory neuron membrane proteins (SNMPs) which is still largely unknown, despite their necessity for olfaction.

Applied Developmental Biology. Biotechnological improvements on the Sterile Insect Technique (SIT). SIT is a successful genetic pest management strategy to prevent, control, suppress, or even eradicate invasive insect pest species from islands, large agricultural production areas, or even complete continents. SIT is a species-specific and eco-friendly insect birth control measure involving mass production, sterilization, and sustained area-wide release of large quantities of sterilized insects. This leads to unproductive matings, which shrinks the population. Our current biotechnological efforts improve on transgenic female-specific lethality systems to enable more efficient male-only releases, on reproductive sterility systems to overcome the problem of radiation-reduced fitness, and on transgenic markers to better monitor the efficacy of SIT applications.

- Appointed as Head of the Department of Stem Cell Biology at the University of Göttingen, 2004
- Appointed as Head of the Department of Anatomy and Cell Biology at the University of Göttingen, 2010

Major Research Interests

The research activities in the Wodarz laboratory focus mainly on different aspects of the asymmetric division of neural stem cells. Asymmetric cell division is a fundamental mechanism for the generation of cell diversity in complex organisms. At the same time, asymmetric cell division is essential for the balance between stem cells and differentiating cells in an organism. Disturbances of this balance can cause severe diseases, including cancer and neurodevelopmental disorders. Asymmetric cell division is intricately linked to the control of apical-basal cell polarity, which is investigated in a second research focus. The establishment and maintenance of apical-basal cell polarity is connected to the regulation of planar cell polarity (PCP) and cell adhesion, especially in epithelial tissues. In this context, we investigate the function of the evolutionarily conserved Wnt signal transduction pathway in the regulation of PCP and cell adhesion. The model organism of our research is mainly the fruit fly *Drosophila melanogaster*, as it is easily accessible to genetic manipulation and is very well suited for cell biological analyses using high-resolution light microscopy.
